

Linux & LPIC Quick Reference Guide

3rd ed. 2015-07

Foreword

This guide stems from the notes I have been taking while working with Linux and preparing the LPIC-1 and LPIC-2 certifications. As such, it includes quite a good amount of topics for these exams, with some subjects handled in more details than others. I started writing this guide in 2013 and it is my aim to update and integrate it periodically.

This document is an independent publication and is not affiliated with, authorized by, sponsored by, or otherwise approved by the Linux Professional Institute. You can freely use and share this guide or the individual pages, both in electronic or in printed form, provided that you distribute it unmodified and not-for-profit. Please feel free to contact me for any error, inaccuracy, or unclear point so I can correct it in future editions.

Happy Linux hacking,

Daniele Raffo

Text processors40	Network system files	HTML images124
Vi	Network configuration files	HTML tables and lists125
Vi options42	TCP Wrapper	7-bit ASCII table
-F		

Logical Volume Management (LVM) introduces an abstraction between physical and logical storage that permits a more versatile use of filesystems. LVM uses the Linux device mapper feature (/dev/mapper).

Disks, partitions, and RAID devices are made of Physical Volumes, which are grouped into a Volume Group. A Volume Group is divided into small fixed-size chunks called Physical Extents. Physical Extents are mapped one-to-one to Logical Extents. Logical Extents are grouped into Logical Volumes, on which filesystems are created.

How to create a Logical Volume

1.	pvcreate /dev/hda2 /dev/hdb5	Initialize the Physical Volumes to be used with LVM. Devices must be of partition type 0x8E (Linux LVM)
2.	vgcreate -s 8M myvg0 /dev/hda2 /dev/hdb5	Create a Volume Group and define the size of Physical Extents to 8 Mb (default value is 4 Mb)
or	vgextend myvg0 /dev/hda2	or add the Physical Volume to an existing Volume Group
3.	lvcreate -L 1024M -n mydata myvg0	Create a Logical Volume
4.	mkfs -t ext3 /dev/myvg0/mydata	Create a filesystem on the Logical Volume
5.	mount /dev/myvg0/mydata /mydata	The Logical Volume is now mounted and used

How to increase the size of a Logical Volume (only if the underlying filesystem permits it)

vgextend myvg0 /dev/hdc	Extend the Volume Group using the space in hdc
lvextend -L 2048M /dev/myvg0/mydata	Extend the Logical Volume
lvresize -L+2048M /dev/myvg0/mydata	
resize2fs /dev/myvg0/mydata	Extend the filesystem
	lvextend -L 2048M /dev/myvg0/mydata lvresize -L+2048M /dev/myvg0/mydata

How to reduce the size of a Logical Volume (only if the underlying filesystem permits it)

1.	resize2fs /dev/myvg0/mydata 900M	Shrink the filesystem
2.	lvreduce -L 900M /dev/myvg0/mydata	Shrink the Logical Volume
or	lvresize -L-900M /dev/myvg0/mydata	

How to snapshot and backup a Logical Volume

1.	lvcreate -s -L 1024M -n snapshot0 /dev/myvg0/mydata	Create the snapshot just like another Logical Volume
2.	tar cvzf snapshot0.tar.gz snapshot0	Backup the snapshot with any backup tool
3.	lvremove /dev/mvvg0/snapshot0	Delete the snapshot

lvremove /dev/mvvg0/snapshot0 3.

2/126

pvs	Report information about Physical Volumes
pvck	Check Physical Volume metadata
pvdisplay	Display Physical Volume attributes
pvscan	Scan all disks for Physical Volumes
pvremove	Remove a Physical Volume
pvmove	Move the Logical Extents on a Physical Volume to wherever there are available Physical Extents (within the Volume Group) and then put the Physical Volume offline
vqs	Report information about Volume Groups
vgck	
2	Check Volume Group metadata
vgmerge	Merge two Volume Groups
vgimport	Import a Volume Group into a system
vgexport	Export a Volume Group from a system
vgchange	Change Volume Group attributes
vgextend	Add a Physical Volume to a Volume Group
vgreduce	Remove a Physical Volume from a Volume Group
lvs	Report information about Logical Volumes
lvchange	Change Logical Volume attributes
lvremove	Remove a Logical Volume
lvscan	Scan all disks for Logical Volumes

	Boot sequence	
POST (Power-On Self Test)	Low-level check of PC hardware.	
BIOS (Basic I/O System)	Detection of disks and hardware.	
Chain loader GRUB (GRand Unified Bootloader)	 GRUB stage 1 is loaded from the MBR and executes GRUB stage 2 from filesystem. GRUB chooses which OS to boot on. The chain loader hands over to the boot sector of the partition on which resides the OS. The chain loader also mounts initrd, an initial ramdisk (typically a compressed ext2 filesystem) to be used as the initial root device during kernel boot; this make possible to load kernel modules that recognize hard drives hardware and that are hence needed to mount the real root filesystem. Afterwards, the system runs /linuxrc with PID 1. (From Linux 2.6.13 onward, the system instead loads into memory initramfs, a cpio-compressed image, and unpacks it into an instance of tmpfs in RAM. The kernel then executes /init from within the image.) 	
Linux kernel	Kernel decompression into memory. Kernel execution. Detection of devices. The real root filesystem is mounted on / in place of the initial ramdisk.	
init	Execution of init, the first process (PID 1). The system tries to execute in the following order: /sbin/init /etc/init /bin/init /bin/sh If none of these succeeds, the kernel will panic.	
Startup	The system loads startup scripts and runlevel scripts.	
X Server	(Optional) The X Display Manager starts the X Server.	

Some newer systems use UEFI (Unified Extensible Firmware Interface). UEFI does not use the MBR boot code; it has knowledge of partition table and filesystems, and stores its application files required for launch in a EFI System Partition, mostly formatted as FAT32.

After the POST, the system loads the UEFI firmware which initializes the hardware required for booting, then reads its Boot Manager data to determine which UEFI application to launch. The launched UEFI application may then launch another application, e.g. the kernel and initramfs in case of a boot loader like the GRUB.

OS startup sequence (SysV)	Debian	Red Hat	
At startup /sbin/init executes all instructions on /etc/inittab . This script at first switches to the default runlevel	id:2:initdefault:	<pre>id:5:initdefault:</pre>	
then it runs the following script (same for all runlevels) which configures peripheral hardware, applies kernel parameters, sets hostname, and provides disks initialization	/etc/init.d/rcS	/etc/rc.d/rc.sysinit Or /etc/rc.sysinit	
and then, for runlevel <i>N</i> , it calls the script /etc/init.d/rc <i>N</i> (i.e. with the runlevel number as parameter) which launches all services and daemons specified in the following startup directories:	/etc/rcN.d/	/etc/rc.d/rcN.d/	
The startup directories contain symlinks to the init scripts in /etc/init.d/ which are executed in numerical order. Links starting with K are called with argument stop, links starting with S are called with argument start.			
<pre>lrwxrwxrwx. 1 root root 14 Feb 11 22:32 K88sssd ->/init.d/sssd lrwxrwxrwx. 1 root root 15 Nov 28 14:50 K89rdisc ->/init.d/rdisc lrwxrwxrwx. 1 root root 17 Nov 28 15:01 S01sysstat ->/init.d/sysstat lrwxrwxrwx. 1 root root 18 Nov 28 14:54 S05cgconfig ->/init.d/cgconfig lrwxrwxrwx. 1 root root 16 Nov 28 14:52 S07iscsid ->/init.d/iscsid lrwxrwxrwx. 1 root root 18 Nov 28 14:42 S08iptables ->/init.d/iptables</pre>			
The last script to be run is S99local ->/init.d/rc.local; therefore, an easy way to run a specific program upon boot is to call it from this script file.			
/etc/init.d/boot.localruns only at boot time, not when switching runlevel./etc/init.d/before.local(SUSE)/etc/init.d/after.local(SUSE)runs only at boot time, after the scripts in the startup directories.			
To add or remove services at boot sequence:	update-rc.d <i>service</i> defaults update-rc.d -f <i>service</i> remove	chkconfigadd service chkconfigdel service	

Parameters (service operations) supported by the init scripts		
start	Start the service	
stop	Stop the service	
restart	Restart the service (stop, then start)	Mandatory
status	Display daemon PID and execution status	
force-reload	Reload configuration if the service supports this option, otherwise restart the service	
condrestart try-restart	Restart the service only if already running Optional	
reload	Reload service configuration	•

Linux Standard Base (LSB)

LSB defines a format to specify the default values on an init script /etc/init.d/foo:

```
### BEGIN INIT INFO
# Provides: foo
# Required-Start: bar
# Defalt-Start: 2 3 4 5
# Default-Stop: 0 1 6
# Description: Service Foo init script
### END INIT INFO
```

Default runlevels and S/K symlinks values can also be specified as such:

chkconfig: 2345 85 15
description: Foo service

Runlevel	Debian	Red Hat		
0	Shute	Shutdown		
1	Single user / ma	Single user / maintenance mode		
2	Multi-user mode (default)	Multi-user mode without network		
3	Multi-user mode	Multi-user mode with network		
4	Multi-user mode	Unused, for custom use		
5	Multi-user mode	Multi-user mode with network and X (default)		
6	Reboot			
S	Single user / maintenance mode (usually accessed through runlevel 1)			

The default runlevels are 2 3 4 5

runlevel who -r	Display the previous and the current runlevel
init <i>runlevel</i> telinit <i>runlevel</i>	Change runlevel
init 0 telinit 0 shutdown -h now halt poweroff	Halt the system
init 6 telinit 6 shutdown -r now reboot	Reboot the system
shutdown	Shut down the system in a secure way: all logged in users are notified via a message to their terminal, and login is disabled. This command can be run only by the root user and by those users (if any) listed in /etc/shutdown.allow
shutdown -h 16:00 <i>message</i>	Schedule a shutdown for 4 PM and send a warning message to all logged in users
shutdown -a	Non-root users that are listed in $/{\tt etc/shutdown.allow}$ can use this command to shut down the system
shutdown -f	Skip fsck on reboot
shutdown -F	Force fsck on reboot
shutdown -c	Cancel an already running shutdown

SysV vs Systemd init scripts

System V		Systemd	Action
<pre>/etc/init.d/service operation service service operation rcservice operation</pre>	(Red Hat) (SUSE)	systemctl operation service	Perform one of these operations on the specified service: start stop restart status force-reload condrestart try-restart reload
update-rc.d <i>service</i> defaults chkconfigadd <i>service</i>	(Debian) (Red Hat)		Add a service at boot
update-rc.d -f <i>service</i> remove chkconfigdel <i>service</i>	e (Debian) (Red Hat)		Remove a service at boot
When adding or removing a servic default runlevels: K symlinks for rule In System V, the service will be ru	unlevels 0 1 6,	up directories will be updated by crea and S symlinks for runlevels 2 3 4 5. ad super server.	ting or deleting symlinks for the
update-rc.d -f <i>service</i> \ start 30 2 3 4 5 . stop 70 0	16.		Add a service on the default runlevels; create S30 symlinks for starting the service and K70 symlinks for stopping it
chkconfiglevels 245 servic	ce on		Add the service on runlevels 2 4 5
chkconfig <i>service</i> on		systemctl enable service	Add the service on default runlevels
chkconfig service off		systemctl disable service	Remove the service on default runlevels
chkconfig service		systemctl is-enabled service	Check if the service is enabled on the current runlevel
chkconfig <i>service</i> reset			Reset the on/off state of the service for all runlevels to whatever the Linux Standard Base specifies in the init script
chkconfig <i>service</i> resetpriori	ties		Reset the start/stop priorities of the service for all runlevels to whatever the Linux Standard Base specifies in the init script
chkconfiglist service			Display current configuration of service (its status and the runlevels in which it is active)
chkconfiglist		<pre>systemctl list-unit-files \type=service</pre>	List all active services and their current configuration

#

/etc/inittab

The	default	runlevel.
d:2:1	initdefau	ult:

id # Boot-time system configuration/initialization script. # This is run first except when booting in emergency (-b) mode. si::sysinit:/etc/init.d/rcS # What to do in single-user mode. ~~:S:wait:/sbin/sulogin # /etc/init.d executes the S and K scripts upon change of runlevel. 10:0:wait:/etc/init.d/rc 0 ll:1:wait:/etc/init.d/rc 1 12:2:wait:/etc/init.d/rc 2 13:3:wait:/etc/init.d/rc 3 14:4:wait:/etc/init.d/rc 4 15:5:wait:/etc/init.d/rc 5 l6:6:wait:/etc/init.d/rc 6 # Normally not reached, but fall through in case of emergency. z6:6:respawn:/sbin/sulogin # /sbin/getty invocations for the runlevels. # Id field must be the same as the last characters of the device (after "tty"). 1:2345:respawn:/sbin/getty 38400 tty1

/etc/inittab describes which processes are started at bootup and during normal operation; it is read and executed by init at bootup.

All its entries have the form *id*:*runlevels*:*action*:*process*

2:23:respawn:/sbin/getty 38400 tty2

id		1-4 characters, uniquely identifies an entry. For gettys and other login processes it should be equal to the suffix of the corresponding tty		
runlevels		Runlevels for which the specified action must be performed. If empty, action is performed on all runlevels		
	respawn	Process will be restarted when it terminates		
	wait	Process is started at the specified runlevel and init will wait for its termination (i.e. execution of further lines of /etc/inittab stops until the process exits)		
	once	Process is executed once at the specified runlevel		
	boot	Process is executed at system boot. Runlevels field is ignored		
	bootwait	Process is executed at system boot and init will wait for its termination. Runlevels field is ignored		
	off	Does nothing		
	ondemand	Process is executed when an on-demand runlevel (A, B, C) is called		
action	initdefault	Specifies the default runlevel to boot on. Process field is ignored		
uction	sysinit	Process is executed at system boot, before any boot or bootwait entries. Runlevels field is ignored		
	powerfail	Process is executed when power goes down and an UPS kicks in. init will not wait for its termination		
	powerwait	Process is executed when power goes down and an UPS kicks in. init will wait for its termination		
	powerfailnow	Process is executed when power is down and the UPS battery is almost empty		
	powerokwait	Process is executed when power has been restored from UPS		
	ctrlaltdel	Process is executed when init receives a SIGINT via CTRL ALT DEL		
	kbdrequest	Process is executed when a special key combination is pressed on console		
process	Process to execute.	If prepended by a +, utmp and wtmp accounting will not be done		

8/126

	Filesystem Hierarchy Standard (FHS)
/bin	Essential command binaries
/boot	Bootloader files (e.g. OS loader, kernel image, initrd)
/dev	Devices and partitions
/etc	System configuration files and scripts
/home	Home directories for users
/lib	Libraries for the binaries in /bin and /sbin, kernel modules
/lost+found	Storage directory for recovered files in this partition
/media	Mount points for removable media
/mnt	Mount points for temporary filesystems
/net	Access to directory tree on different external NFS servers
/opt	Optional, large add-on application software packages
/proc	Virtual filesystem providing kernel and processes information
/root	Home directory for the root user
/sbin	Essential system binaries, system administration commands
/srv	Data for services provided by the system
/tmp	Temporary files
/usr	User utilities and applications
/usr/bin	Non-essential command binaries (for all users)
/usr/lib	Libraries for the binaries in /usr/bin and /usr/sbin
/usr/sbin	Non-essential system binaries (daemons and services)
/usr/src	Source code
/usr/local	Software installed locally
/usr/local/bin	Local software binaries
/usr/local/games	Local game binaries
/usr/local/include	Local C header files
/usr/local/lib	Local libraries for the binaries in /usr/local/bin and /usr/local/sbin
/usr/local/man	Local manuals
/usr/local/sbin	Local system binaries
/usr/local/share	Local architecture-independent hierarchy
/usr/local/src	Local source code
/var	Variable files (e.g. logs, caches, mail spools)

/dev/hda, /dev/hdb, /dev/hdc	first, second, third IDE hard drive
/dev/sda, /dev/sdb, /dev/sdc	first, second, third SATA hard drive
/dev/sda1, /dev/sda2, /dev/sda3	first, second, third partition of the first SATA drive

Partitioning limits for Linux:

Max 4 primary partitions per hard disk, or 3 primary partitions + 1 extended partition Max 11 logical partitions (inside the extended partition) per hard disk Partition numbers: 1-4 Partition numbers: 5-15

The superblock contains information relative to the filesystem: e.g. filesystem type, size, status, metadata structures. The Master Boot Record (MBR) is a 512-byte program located in the first sector of the hard disk; it contains information about hard disk partitions and has the duty of loading the OS.

Most modern filesystems use journaling; in a journaling filesystem, the journal logs changes before committing them to the filesystem, which ensures faster recovery and less corruption in case of a crash.

fdisk /dev/sda	Disk partitioning interactive to	ool	
sfdisk /dev/sda	Disk partitioning non-interactive tool		
cfdisk	Text-based UI fdisk		
gparted	GUI fdisk		
fdisk -l /dev/sda	List the partition table of /dev/sda		
partprobe	After fdisk operations, this command can be run to notify the OS of partition table changes. Otherwise, these changes will take place only after reboot		
mkfs -t <i>fstype device</i>			
mkfs -t ext2 /dev/sda mkfs.ext2 /dev/sda mke2fs /dev/sda	Create a ext2 filesystem on /	dev/sda	
mke2fs -j /dev/sda mkfs.ext3 /dev/sda mke3fs /dev/sda	Create a ext3 filesystem (ext2 with journaling) on $/{\tt dev/sda}$		
mkfs -t msdos /dev/sda mkfs.msdos /dev/sda mkdosfs /dev/sda	Create a MS-DOS filesystem of	DN /dev/sda	
mount cat /proc/mounts cat /etc/mtab	Display the currently mounted The commands mount and und mounted filesystems, but /pr	ount maintain in /etc/mtab a database of currently	
mount -a	Mount all devices listed in /et	c/fstab (except those indicated as noauto)	
mount -t ext3 /dev/sda /foobar	Mount a Linux-formatted disk. The mount point (directory) must exist		
mount -t msdos /dev/fd0 /mnt	Mount a MS-DOS filesystem floppy disk to mount point $/mnt$		
mount /dev/fd0	Mount a floppy disk. /etc/fstab must contain an entry for /dev/fd0 $$		
umount /dev/fd0 umount /mnt	Unmount a floppy disk that was mounted on $\ensuremath{/}{\tt mnt}$ (device must not be busy)		
umount -l /dev/fd0	Unmount the floppy disk as soon as it is not in use anymore		
mount -o remount,rw /		s read-write (supposing it was mounted read-only). case, read-only to read-write) for a mounted nounted at the moment	
mount -o nolock 10.7.7.7:/export/	/mnt/nfs	Mount a NFS share without running NFS daemons. Useful during system recovery	
mount -t iso9660 -o ro,loop=/dev/	loop0 cd.img /mnt/cdrom	Mount a CD-ROM ISO9660 image file like a CD-ROM	

10/126

			Partition types		
0x00	Empty	0x4e	QNX4.x 2nd part	0xa8	Darwin UFS

0x42	SFS	0xa6	OpenBSD	0xff	BBT
0x4d	QNX4.x	0xa7	NeXTSTEP		

List of partition IDs and their names, as obtained by the command ${\tt sfdisk}$ -T

	Most used Linux-supported filesystems
Filesystem	Properties
ext2	Linux default filesystem, offering the best performances
ext3	ext2 with journaling
ext4	Linux journaling filesystem, upgrade from ext3
Reiserfs	Journaling filesystem
XFS	Journaling filesystem, developed by SGI
JFS	Journaling filesystem, developed by IBM
Btrfs	B-tree filesystem, developed by Oracle
msdos	DOS filesystem, supporting only 8-char filenames
umsdos	Extended DOS filesystem used by Linux, compatible with DOS
fat32	MS-Windows FAT filesystem
vfat	Extended DOS filesystem, with support for long filenames
ntfs	Replacement for fat32 and vfat filesystems
minix	Native filesystem of the MINIX OS
iso9660	CD-ROM filesystem
cramfs	Compressed RAM disk
nfs	Network filesystem, used to access files on remote machines
SMB	Server Message Block, used to mount Windows network shares
proc	Pseudo filesystem, used as an interface to kernel data structures
swap	Pseudo filesystem, Linux swap area

In Linux, the swap space is a virtual memory area (a file or a partition) used as RAM extension. Usually a partition is preferred because of better performances concerning fragmentation and disk speed. Although listed as filesystem type 0x82, the swap partition is not a filesystem but a raw addressable memory with no structure.

fdisk	The fdisk tool can be used to create	e a swap partition
dd if=/dev/zero of=/swapf	File bs=1024 count=512000	Create a 512-Mb swap file
mkswap /swapfile	Initialize a (already created) swap f	file or partition
swapon /swapfile swapoff /swapfile	Enable a swap file or partition, thus Disable a swap file or partition	s telling the kernel that it can use it now
swapon -s cat /proc/swaps cat /proc/meminfo free top	Any of these commands can be use	ed to show the sizes of total and used swap areas

	/etc/fstab	Filesyste	ems information		
# <filesystem></filesystem>	<mount point=""></mount>	<type></type>	<options></options>	<dump></dump>	<pass></pass>
/dev/sda2	/	ext2	defaults	0	1
/dev/sdb1	/home	ext2	defaults	1	2
/dev/cdrom	/media/cdrom	auto	ro,noauto,user,exec	0	0
/dev/fd0	/media/floppy	auto	rw,noauto,user,sync	0	0
proc	/proc	proc	defaults	0	0
/dev/hda1	swap	swap	pri=42	0	0
nfsserver:/dirs	/mnt	nfs	intr	0	0
//smbserver/jdoe	/shares/jdoe	cifs	auto,credentials=/et	tc/smbc:	reds 00
LABEL=/boot	/boot	ext2	defaults	0	0
UUID=652b786e-b87	E-49d2-af23-8087ced	10c667 /te	est ext4 errors=remount	t-ro,noa	atime 0 0

filesystem		Device or partition. The filesystem can be identified either by its name, its label, or its UUID (Universal Unique Identifier) which is a 128-bit hash number that is associated to the partition at its initialization			
mount point	Directory on which the partition must be mounted				
type	Filesystem type, or auto if detected automatically				
	defaults	Use the default options: rw, suid, dev, exec, auto, nouser, async			
	ro	Mount read-only			
	rw	Mount read-write			
	suid	Permit SUID and SGID bit operations			
	nosuid	Do not permit SUID and SGID bit operations			
	dev	Interpret block special devices on the filesystem			
	nodev	Do not interpret block special devices on the filesystem			
	auto	Mount automatically at bootup, or when the command mount -a is given			
	noauto	Mount only if explicitly demanded			
	user	Partition can be mounted by any user			
	nouser	Partition can be mounted only by the root user			
	exec	Binaries contained on the partition can be executed			
	noexec	Binaries contained on the partition cannot be executed			
ontions	sync	Write files immediately to the partition			
options	async	Buffer write operations and commit them later, or when device is unmounted			
	rsize=nnn	NFS: Size for read transfers (from server to client)			
	wsize=nnn	NFS: Size for write transfers (from client to server)			
	nfsvers=n	NFS: Version of NFS to use for transport			
	retry=n	NFS: Time to keep retrying a mount attempt before giving up, in minutes			
	timeo=n	NFS: Time after a mount attempt times out, in tenths of a second			
	intr	NFS: User can interrupt a mount attempt			
	nointr	NFS: User cannot interrupt a mount attempt (default)			
	hard	NFS: The system will try a mount indefinitely (default)			
	soft	NFS: The system will try a mount until an RPC timeout occurs			
	bg	NFS: The system will try a mount in the foreground, all retries occur in the background			
	fg	NFS: All mount attempts occur in the foreground (default)			
	tcp	NFS: Connect using TCP			
	udp	NFS: Connect using UDP			
dump	Dump (backup 0 = do not backup	o utility) options. ckup			
pass		Fsck (filesystem check utility) options. Defines in which order the filesystems should be checked; 0 = do not check			

/etc/fstab

13/126

Filesystem operations

df df -h	Report filesystem disk spac Report filesystem disk spac	e usage e usage in human-readable output
df /path/mydir		specified directory is mounted
lsblk	List information about all a	vailable block devices
lsscsi	List information about all S	CSI devices
blockdevgetbsz /dev/sdal	Get the block size of the sp	ecified partition
sync		it all pending writes. Linux filesystems, many write operations are buffered in RAM are done in any case before unmount, reboot, or shutdown
chroot /mnt/sysimage	Start a shell with /mnt/sys Useful during system recov media (which hence is defin	ery when the machine has been booted from a removable
mknod /dev/sda	Create a directory allocatin Useful during system recov	g the proper inode. ery when experiencing filesystem problems
hdparm	Get/set drive parameters for	or SATA/IDE devices
hdparm -g /dev/hda	Display drive geometry (cy	linders, heads, sectors) of /dev/hda
hdparm -i /dev/hda	Display identification inform	nation for /dev/hda
hdparm -tT /dev/hda	Perform benchmarks on the /dev/hda drive	
hdparm -p 12 /dev/hda	Reprogram IDE interface cl	nipset of /dev/hda to mode 4. Use with caution!
sdparm	Access drive parameters fo	r SCSI devices
blkid -U 652b786e-b87f-49d2-	af23-8087ced0c667	Print the name of the specified partition, given its UUID
blkid -L /boot		Print the UUID of the specified partition, given its label
findfs UUID=652b786e-b87f-49	d2-af23-8087ced0c667	Print the name of the specified partition, given its UUID
findfs LABEL=/boot		Print the name of the specified partition, given its label
e2label /dev/sda1		Print the label of the specified partition, given its name

fsck device	Check and repair a Linux filesystem (which must be unmounted). Corrupted files will be placed into the /lost+found of the partition. The exit code returned is the sum of the following conditions:		
	0No errors8Operational error1File system errors corrected16Usage or syntax error2System should be rebooted32Fsck canceled by user4File system errors left uncorrected128Shared library error		
	<pre>fsck is a wrapper utility for the actual filesystem-specific checker commands: fsck.ext2 aka e2fsck fsck.ext3 fsck.ext4 fsck.msdos fsck.vfat fsck.cramfs</pre>		
fsck fsck -As	Check and repair serially all filesystems listed in $/\texttt{etc/fstab}$		
fsck -f /dev/sdal	Force a filesystem check on /dev/sda1 even if it thinks is not necessary		
fsck -y /dev/sdal	During filesystem repair, do not ask questions and assume that the answer is always yes		
fsck.ext2 -c /dev/sda1 e2fsck -c /dev/sda1	Check a ext2 filesystem, running the <code>badblocks</code> command to mark all bad blocks and add them to the bad block inode to prevent them from being allocated to files or directories		
tune2fs [options] device	Adjust tunable filesystem parameters on ext2/ext3/ext4 filesystems		
tune2fs -j /dev/sdal	Add a journal to this ext2 filesystem, making it a ext3		
tune2fs -C 4 /dev/sdal	Set the mount count of the filesystem to 4		
tune2fs -c 20 /dev/sdal	Set the filesystem to be checked by fsck after 20 mounts		
tune2fs -i 15d /dev/sdal	Set the filesystem to be checked by fsck each 15 days		

Both mount-count-dependent and time-dependent checking are enabled by default for all hard drives on Linux, to avoid the risk of filesystem corruption going unnoticed.

dumpe2fs [options] device	Dump ext2/ext3/ext4 filesystem information
dumpe2fs -h /dev/sdal	Display filesystem's superblock information (e.g. number of mounts, last checks, UUID)
dumpe2fs /dev/sda1 grep -i superblock	Display locations of superblock (primary and backup) of filesystem
dumpe2fs -b /dev/sdal	Display blocks that are marked as bad in the filesystem
debugfs <i>device</i>	Interactive ext2/ext3/ext4 filesystem debugger
debugfs -w /dev/sdal	Debug /dev/sda1 in read-write mode (by default, debugfs accesses the device in read-only mode)

Many hard drives feature the Self-Monitoring, Analysis and Reporting Technology (SMART) whose purpose is to monitor the reliability of the drive, predict drive failures, and carry out different types of drive self-tests. The smartd daemon attempts to poll this information from all drives every 30 minutes, logging all data to syslog.

smartctl -a /dev/sda	Print SMART information for drive /dev/sda
smartctl -s off /dev/sda	Disable SMART monitoring and log collection for drive $/{\tt dev}/{\tt sda}$
smartctl -t long /dev/sda	Begin an extended SMART self-test on drive /dev/sda

XFS, ReiserFS, CD-ROM fs

xfs_growfs [options] mountpoint	Expand an XFS filesystem (there must be at least one spare new disk partition available)
xfs_info /dev/sda1 xfs_growfs -n /dev/sda1	Print XFS filesystem geometry
xfs_check [options] device	Check XFS filesystem consistency
xfs_repair [options] device	Repair a damaged or corrupt XFS filesystem
xfsdump -v silent -f /dev/tape /	Dump the root of a XFS filesystem to tape, with lowest level of verbosity. Incremental and resumed dumps are stored in the inventory database /var/lib/xfsdump/inventory
xfsrestore -f /dev/tape /	Restore a XFS filesystem from tape
xfsdump -J - / xfsrestore -J - /new	Copy the contents of a XFS filesystem to another directory (without updating the inventory database)
reiserfstune [options] device	Adjust tunable filesystem parameters on ReiserFS filesystem
debugreiserfs <i>device</i>	Interactive ReiserFS filesystem debugger

mkisofs -r -o cdrom.img data/

Create a CD-ROM image from the contents of the target directory. Enable Rock Ridge extension and set all content on CD to be public readable (instead of inheriting the permissions from the original files)

CD-ROM filesystems			
Filesystem		Commands	
ISO9660		mkisofs	Create a ISO9660 filesystem
		mkudffs	Create a UDF filesystem
UDF (Universal Disk Format)		udffsck	Check a UDF filesystem
		wrudf	Maintain a UDF filesystem
		cdrwtool	Manage CD-RW drives (disk format, read/write speed,)
HFS (Hierarchi	HFS (Hierarchical File System)		
CD-ROM filesystem extensions			
Rock Ridge	Rock Ridge Contains the original file information (e.g. permissions, filename) for MS Windows 8.3 filenames		
MS Joliet	Used to create more MS Windows friendly CD-ROMs		
El Torito	Used to create bootable CD-ROMs		

AutoFS permits automounting of filesystems, even for nonprivileged users.

AutoFS is composed of the autofs kernel module that monitors specific directories for attempts to access them, and in this case signals the automount userspace daemon which mounts the directory when it needs to be accessed and unmounts it when no longer accessed.

/etc/auto.master	Primary configuration file for AutoFS. Each line is an indirect map; each map file stores the configuration for the automounti subdir.			he configuration for the automounting of the
	# mount poi /misc	.nt map /etc/auto.misc	options	
	/home	/etc/auto.home	timeout=	60
/etc/auto.misc	Configuration	n file for automounting of	directory /mi	.sc.
	public	options -ro,soft,intr -fstype=iso9660,ro,no	suid,nodev	filesystem ftp.example.org:/pub :/dev/cdrom
/etc/auto.home	5			$_{\rm me}$. pts to access, and the $_{\rm \&}$ variable takes the
		options -rw,soft,intr		filesystem nfsserver.example.org:/home/&

The /net/nfsserver/ tree allows nonprivileged users to automatically access any *nfsserver*.

	RAID levels			
Level	Description	Storage capacity		
RAID 0	Striping (data is written across all member disks). High I/O but no redundancy	Sum of the capacity of member disks		
RAID 1	Mirroring (data is mirrored on all disks). High redundancy but high cost	Capacity of the smaller member disk		
RAID 4	Parity on a single disk. I/O bottleneck unless coupled to write-back caching	Sum of the capacity of member disks, minus one		
RAID 5	Parity distributed across all disks. Can sustain one disk crash	Sum of the capacity of member disks, minus one		
RAID 6	Double parity distributed across all disks. Can sustain two disk crashes	Sum of the capacity of member disks, minus two		
RAID 10 (1+0)	Striping + mirroring. High redundancy but high cost	Capacity of the smaller member disk		
Linear RAID	Data written sequentially across all disks. No redundancy	Sum of the capacity of member disks		

```
mdadm -C /dev/md0 -l 5 \setminus
                                                 Create a RAID 5 array from three partitions and a spare.
-n 3 /dev/sdb1 /dev/sdc1 /dev/sdd1 \backslash
                                                 Partitions type must be set to 0xFD.
-x 1 /dev/sde1
                                                 Once the RAID device has been created, it must be formatted e.g. via
                                                 mke2fs -j /dev/md0
mdadm --manage /dev/md0 -f /dev/sdd1
                                                 Mark a drive as faulty, before removing it
mdadm --manage /dev/md0 -r /dev/sdd1
                                                 Remove a drive from the RAID array.
                                                 The faulty drive can now be physically removed
mdadm --manage /dev/md0 -a /dev/sdd1
                                                 Add a drive to the RAID array.
                                                 To be run after the faulty drive has been physically replaced
mdadm --misc -Q /dev/sdd1
                                                 Display information about a device
mdadm --misc -D /dev/md0
                                                 Display detailed information about the RAID array
mdadm --misc -o /dev/md0
                                                 Mark the RAID array as readonly
mdadm --misc -w /dev/md0
                                                 Mark the RAID array as read & write
/etc/mdadm.conf
                                                 Configuration file for {\tt mdadm} .
                                                 DEVICE /dev/sdb1 /dev/sdc1 /dev/sdd1 /dev/sde1
                                                 ARRAY /dev/md0 level=raid5 num-devices=3
                                                    UUID=0098af43:812203fa:e665b421:002f5e42
                                                    devices=/dev/sdb1,/dev/sdc1,/dev/sdd1,/dev/sde1
```

cat /proc/mdstat

Display information about RAID arrays and devices

		Non-GRUB	bootloaders	
	LO Loader)	Obsolete. Small bootloader that can be placed in the MBR or the boot sector of a partition. The configuration file is /etc/lilo.conf (run /sbin/lilo afterwards to validate changes).		
	SYSLINUX	Able to boot from FAT and NTFS filesystems e.g. floppy disks and USB drives. Used for boot floppy disks, rescue floppy disks, and Live USBs.		
	ISOLINUX	Able to boot from CD-ROM ISO 9 Used for Live CDs and bootable		
		The CD must contain the following	ng files:	
		isolinux/isolinux.bin	ISOLINUX image, from the SYSLINUX distro	
		boot/isolinux/isolinux.cfg	ISOLINUX configuration	
		images/	Floppy images to boot	
		kernel/memdisk		
		The CD can be burnt with the command: mkisofs -o output.iso -b isolinux/isolinux.bin -c isolinux/boot.cat \ -no-emul-boot -boot-load-size 4 -boot-info-table [CD root dir] Able to boot from PXE (Pre-boot eXecution Environment). PXE uses DHCP or BOOTP to enable basic networking, then uses TFTP to download a bootstrap program that loads and configures the kernel. Used for Linux installations from a central server or network boot of diskless workstations.		
SYSLINUX	PXELINUX			
		The boot TFTP server must contain the following files:		
		/tftpboot/pxelinux.0	PXELINUX image, from the SYSLINUX distro	
		/tftpboot/pxelinux.cfg/	Directory containing a configuration file for each machine. A machine with Ethernet MAC address 88:99:AA:BB:CC:DD and IP address 192.0.2.91 (C000025B in hexadecimal) will search for its config filename in this order: 01-88-99-aa-bb-cc-dd C00025B C000025 C00002 C0000 C000 C00 C0 C0 default	
	EXTLINUX	General-purpose bootloader like	LILO or GRUB. Now merged with SYSLINUX.	

GRUB (Grand Unified Bootloader) is the standard boot manager on modern Linux distros, which may use either version: GRUB Legacy or GRUB 2.

GRUB Stage 1 (446 bytes), as well as the partition table (64 bytes) and the boot signature (2 bytes), is stored in the 512byte MBR. It then accesses the GRUB configuration and commands available on the filesystem, usually on /boot/grub.

/boot/grub/menu.lst or /boot/grub/grub.conf GRUB Legacy configuration file
timeout 10 # Boot the default kernel after 10 seconds default 0 # Default kernel is 0
<pre># Section 0: Linux boot title Debian # Menu item to show on GRUB bootmenu root (hd0,0) # root filesystem is /dev/hda1 kernel /boot/vmlinuz-2.6.24-19-generic root=/dev/hda1 ro quiet splash initrd /boot/initrd.img-2.6.24-19-generic</pre>
<pre># Section 1: Windows boot title Microsoft Windows XP root (hd0,1) # root filesystem is /dev/hda2 savedefault makeactive # set the active flag on this partition chainloader +1 # read 1 sector from start of partition and run</pre>
<pre># Section 2: Firmware/BIOS update from floppy disk title Firmware update kernel /memdisk # boot a floppy disk image initrd /floppy-img-7.7.7</pre>

	root=	Specify the location of the filesystem root. This is a required parameter
	ro	Mount read-only on boot
	quiet	Disable non-critical kernel messages during boot
Common	debug	Enable kernel debugging
kernel parameters:	splash	Show splash image
which asks for the root password for system		Emergency mode: after the kernel is booted, run sulogin (single-user login) which asks for the root password for system maintenance, then run a Bash. Does not load init or any daemon or configuration setting.
	init=/bin/bash	Run a Bash shell (may also be any other executable) instead of init

/boot/grub/grub.cfg GRUB 2 configuration file

```
# Linux Red Hat
menuentry "Fedora 2.6.32" {
                              # Menu item to show on GRUB bootmenu
set root=(hd0,1)
                              # root filesystem is /dev/hda1
linux /vmlinuz-2.6.32 ro root=/dev/hda5 mem=2048M
initrd /initrd-2.6.32
}
# Linux Debian
menuentry "Debian 2.6.36-experimental" {
set root=(hd0,1)
linux (hd0,1)/bzImage-2.6.36-experimental ro root=/dev/hda6
}
# Windows
menuentry "Windows" {
set root=(hd0,2)
chainloader +1
```

This file must not be edited manually. Instead, edit the files in /etc/grub.d/ (these are scripts that will be run in order) and the file /etc/default/grub (the configuration file for menu display settings), then run update-grub.

The GRUB menu, presented at startup, permits to choose the OS or kernel to boot:

ENTER	Boot the selected GRUB	3 entry
С	Get a GRUB command I	ine
•		entry (e.g. to edit kernel parameters in order to boot in single-user emergency mode, port of a device driver compiled in the kernel)
В	Boot the GRUB entry or	nce it has been modified
Р	Bring up the GRUB pass	sword prompt (necessary if a GRUB password has been set)
grub-insta	ll /dev/sda	Install GRUB on first SATA drive
grub		Access the GRUB shell
/boot/grub	/device.map	This file can be created to map Linux device filenames to BIOS drives:

This file can be created to map Linux device filenames to BIOS drives:

(fd0) /dev/fd0 (hd0) /dev/hda

GRUB Legacy shell commands			
blocklist <i>file</i>	Print the block list notation of a file	kernel file	Load a kernel
boot	Boot the loaded OS	lock	Lock a GRUB menu entry
cat file	Show the contents of a file	makeactive	Set active partition on root disk to GRUB's root device
chainloader file	Chainload another bootloader	map drivel drive2	Map a drive to another drive
cmp file1 file2	Compare two files	md5crypt	Encrypt a password in MD5 format
configfile file	Load a configuration file	module <i>file</i>	Load a kernel module
debug	Toggle debugging mode	modulenounzip <i>file</i>	Load a kernel module without decompressing it
displayapm	Display APM BIOS information	pause <i>message</i>	Print a message and wait for a key press
displaymem	Display memory configuration	quit	Quit the GRUB shell
embed stage device	Embed Stage 1.5 in the device	reboot	Reboot the system
find file	Find a file	read <i>address</i>	Read a 32-bit value from memory and print it
fstest	Toggle filesystem test mode	root <i>device</i>	Set the current root device
geometry drive	Print information on a drive geometry	rootnoverify <i>device</i>	Set the current root device without mounting it
halt	Shut down the system	savedefault	Save current menu entry as the default entry
help command	Show help for a command, or the available commands	setup <i>device</i>	Install GRUB automatically on the device
impsprobe	Probe the Intel Multiprocessor Specification	testload <i>file</i>	Test the filesystem code on a file
initrd <i>file</i>	Load an initial ramdisk image file	testvbe mode	Test a VESA BIOS EXTENSION mode
install options	Install GRUB (deprecated, use setup instead)	uppermem kbytes	Set the upper memory size (only for old machines)
ioprobe <i>drive</i>	Probe I/O ports used for a drive	vbeprobe <i>mode</i>	Probe a VESA BIOS EXTENSION mode

Low-level package managers	Debian	Red Hat
Install a package file	dpkg -i <i>package.deb</i>	<pre>rpm -i package.rpm rpm -i ftp://host/package.rpm rpm -i http://host/package.rpm</pre>
Remove a package	dpkg -r <i>package</i>	rpm -e <i>package</i>
Upgrade a package (and remove old versions)		rpm -U package.rpm
Upgrade a package (only if an old version is already installed)		rpm -F package.rpm
List installed packages and their state	dpkg -l	rpm -qa
List the content of an installed package	dpkg -L <i>package</i>	rpm -ql <i>package</i>
List the content of a package file	dpkg -c <i>package.deb</i>	rpm -qpl package.rpm
Show the package containing a specific file	dpkg -S file	rpm -qf file
Verify an installed package		rpm -V package
Reconfigure a package	dpkg-reconfigure package	
Install a package source file		rpm -i package.src.rpm
Compile a package source file		rpm -ba package.spec
High-level package managers		
Install a package	apt-get install <i>package</i>	yum install package
Install a package file		yum install package.rpm yum localinstall package.rpm
Remove a package	apt-get remove <i>package</i>	yum remove package
Upgrade an installed package		yum update package
Upgrade all installed packages	apt-get upgrade	yum update
Upgrade all installed packages and handle dependencies with new versions	apt-get dist-upgrade	
Get the source code for a package	apt-get source package	
Check for broken dependencies and update package cache	apt-get check	
Fix broken dependencies	apt-get install -f	
Update information on available packages	apt-get update	
List all available packages		yum list
Search for a package	apt-cache search package	yum search package
Show package dependencies	apt-cache depends package	yum deplist package
Show package records	apt-cache show package	yum list package
Show information about a package	apt-cache showpkg package	yum info <i>package</i>
Update information about package contents	apt-file update	
List the content of an uninstalled package	apt-file list package	
Show the package containing a specific file	apt-file search <i>file</i>	yum whatprovides file
Add a CD-ROM to the sources list	apt-cdrom add	
Download package and resolve dependencies		yumdownloaderresolve package
Show URLs that would be downloaded		yumdownloaderurls package
Print list of available repositories	cat /etc/apt/sources.list	yum repolist cat /etc/yum.repos.d/*.repo
Package format	compressed with ar	compressed with cpio

High-level package managers are able to install remote packages and automatically solve dependencies.

Text-based UI or graphical tools	Debian	Red Hat	
	aptitude	pirut	
Manage packages and dependencies	dselect		
	synaptic		
Other tools			
Convert a RPM package to DEB and install it. Might break the package system!	alien -i package.rpm		
Convert a RPM package to cpio archive		rpm2cpio package.rpm	

dd if=/dev/sda of=/dev/sdb	Copy the content of one hard disk over another, byte by byte
dd if=/dev/sdal of=sdal.img	Create the image of a partition
dd if=/dev/cdrom of=cdrom.iso bs=2048	Create an ISO file from a CD-ROM, using a block size of 2 Kb
rsync -rzv /home /tmp/bak rsync -rzv /home/ /tmp/bak/home	Synchronize the content of the home directory with the temporary backup directory. Use recursion, compression, and verbosity. For all transfers subsequent to the first, rsync only copies the blocks that have changed, making it a very efficient backup solution in terms of speed and bandwidth
rsync -avz /home root@10.0.0.7:/backup/	Synchronize the content of the home directory with the backup directory on the remote server, using SSH. Use archive mode (operates recursively and preserves owner, group, permissions, timestamps, and symlinks)

	Archive formats
ls cpio -o > myarchive.cpio ls cpio -oF myarchive.cpio	Create a cpio archive of all files that are on the current directory
find /home/ cpio -o > homedirs.cpio	Create a cpio archive of all users' home directories
cpio -id < myarchive.cpio	Extract all files from a cpio archive, recreating the directory structure
cpio -i -t < myarchive.cpio	List the contents of a cpio archive file without extracting it
gzip myfile	Compress a file with gzip
gunzip myfile.gz	Decompress a gzip-compressed file
gunzip -tv myfile.gz	Test the integrity of a gzip-compressed file
zcat myfile.gz	Read a gzip-compressed text file
bzip2 myfile	Compress a file with bzip2
bunzip2 myfile.bz2	Decompress a bzip2-compressed file
bzcat myfile.bz2	Read a bzip2-compressed text file
tar cvf myarc.tar mydir/	Create a tarred archive
tar cvzf myarc.tar.gz mydir/	Create a tarred gzip-compressed archive
tar xvzf myarc.tar.gz	Extract a tarred gzip-compressed archive
tar cvjf myarc.tar.bz2 mydir/	Create a tarred bzip2-compressed archive
tar xvjf myarc.tar.bz2	Extract a tarred bzip2-compressed archive
tar cvJf myarc.tar.xz mydir/	Create a tarred xz-compressed archive
tar xvJf myarc.tar.xz	Extract a tarred xz-compressed archive
tar tvf myarc.tar	List the contents of the tarred archive without extracting it
rar a myarc.rar mydir/	Create a RAR archive
unrar x myarc.rar	Extract a RAR archive

Tape libraries

Devices	/dev/st0	First SCSI tape device	
Devices	/dev/nst0	First SCSI tape device (no-rewind device file)	
Utility for magnetic tapes	mt -f /dev/nst0 asf 3	Position the tape at the start of 3 rd file	
	mtx -f /dev/sgl status	Display status of tape library	
	mtx -f /dev/sgl load 3	Load tape from slot 3 to drive 0	
	mtx -f /dev/sg1 unload	Unload tape from drive 0 to original slot	
Utility for tape libraries	mtx -f /dev/sgl transfer 3 4	Transfer tape from slot 3 to slot 4	
	mtx -f /dev/sgl inventory	Force robot to rescan all slots and drives	
	mtx -f /dev/sgl inquiry	Inquiry about SCSI media device (Medium Changer = tape library)	

© Daniele Raffo www.crans.org/~raffo

man command	Show the man page for a command
man 7 <i>command</i>	Show section 7 of the command man page
man man	 Show information about man pages' sections: 1 Executable programs or shell commands 2 System calls (functions provided by the kernel) 3 Library calls (functions within program libraries) 4 Special files 5 File formats and conventions 6 Games 7 Miscellaneous 8 System administration commands (usually only for root) 9 Kernel routines
cd directory	Change to the specified directory
cd -	Change to the previously used directory
pwd	Print the current working directory
pushd directory	Adds the directory to the top of the directory stack, making it the new current working directory
popd	Removes the top directory from the directory stack and changes to the new top directory
history	Show the history of command lines executed up to this moment. Commands prepended by a space will be executed but will not show up in the history. After the user logs out from Bash, history is saved into ~/.bash_history
! <i>n</i>	Execute command number <i>n</i> in the command line history
history -c	Delete command line history
watch command	Execute command every 2 seconds
watch -d -n 1 command	Execute command every second, highlighting the differences in the output
cat /etc/debian_version (Deb cat /etc/fedora-release (Fed cat /etc/redhat-release (Rec	,
vlock away	Lock the virtual console (terminal)

Almost all Linux commands accept the option -v (verbose), and many commands also accept the option -vv (very verbose).

Bash directory shortcuts				
	Current directory			
	Parent directory			
~	Home directory of current user			
~jdoe	Home directory of user jdoe			
~-	Previously used directory			

cat myfile	Print a text file
cat myfile1 myfile2 > myfile3	Concatenate text files
cat > myfile < <eof line 1 line 2 line 3 EOF</eof 	Creates a Here Document, storing the lines entered in input to a file
head myfile head -n 10 myfile	Print the first 10 lines of a text file
tail myfile tail -n 10 myfile	Print the last 10 lines of a text file
tail -f myfile	Output appended data as the text file grows; useful to read logs in realtime
tac myfile	Print a text file in reverse, from last line to first line
fmt -w 75 myfile	Format a text file so that each line has a max width of 75 chars
pr myfile	Format a text file for a printer
nl myfile	Prepend line numbers to a text file
wc myfile	Print the number of lines, words, and bytes of a text file
join myfile1 myfile2	Join lines of two text files on a common field
paste myfile1 myfile2	Merge lines of text files
split -l 1 myfile	Split a text file into 1-line files (named xaa, xab, xac, and so on)
uniq myfile	Print the unique lines of a text file, omitting consecutive identical lines
sort myfile	Sort alphabetically the lines of a text file
expand myfile	Convert tabs into spaces
unexpand myfile Convert spaces into tabs	
od myfile	Dump a file into octal
grep foo myfile	Print the lines of a file containing foo
grep -v foo myfile	Print the lines of a file not containing foo
grep -v -e foo -e bar myfile	Print the lines of a file not containing neither foo nor bar
cut -d: -f3 myfile	Cut the lines of a file, considering $:$ as the delimiter and printing only the 3^{rd} field
cut -d: -fl /etc/passwd	Print the list of user accounts in the system
cut -c3-50 myfile	Print character 3 to 50 of each line of a file
sed s/foo/bar/ myfile	Stream Editor: Replace the first occurrence of foo with bar
sed s/foo/bar/g myfile	Replace all occurrences of foo with bar
sed -n '7,13p' myfile	Print line 7 to 13 of a text file
tr a-z A-Z <myfile tr [:lower:] [:upper:] <myfile< td=""><td>Translate characters: Convert all lowercase into uppercase in a text file</td></myfile<></myfile 	Translate characters: Convert all lowercase into uppercase in a text file
tr -d 0-9 <myfile tr -d [:digit:] <myfile< td=""><td>Delete all digits from a text file</td></myfile<></myfile 	Delete all digits from a text file
zcat	Print a gzipped file on stdout
zgrep	grep search in a gzipped file
zless	less for gzipped files
zmore	more for gzipped files

26/126

cp myfile myfile2	Copy a file
cp myfile mydir/	Copy a file to a directory Common options:
mv myfile myfile2	Rename a file -i Prompt before overwriting/deleting files (interactive)
mv myfile mydir/	Move a file to a directory -f Don't ask before overwriting/deleting files (force)
rm myfile	Delete a file
pv myfile > myfile2	Copy a file, monitoring the progress of data through the pipe
mkdir mydir	Create a directory
mkdir -m 777 mydir	Create a directory with 777 permission
mkdir -p /tmp/mydir1/mydir2	Create a directory, and create also the parent directories if they don't exist
rmdir mydir	Delete a directory (must be empty)
touch myfile	Change access/modification timestamp on a file, creating it if it doesn't exist
ls	List the contents of the current directory
ls -d */	List directories only
stat myfile	Display file or filesystem status
stat -c %A myfile	Display file permissions
stat -c %s myfile	Display file size, in bytes
lsof	List all open files
lsof -u jdoe	List all files currently open by user jdoe
lsof -i	List open files and their sockets (equivalent to netstat -ap)
lsof -i :80	List connections of local processes on port 80
lsof -i@10.0.0.3	List connections of local processes to remote host 10.0.0.3
lsof -i@10.0.0.3:80	List connections of local processes to remote host 10.0.0.3 on port 80
lsof -c mysqld	List all files opened by the MySQL daemon
<pre>lsof /var/lib/mysql/mysqld.pid</pre>	List all processes which are using a specific file

	File-naming wildcards (globbing)
*	Matches zero or more characters
?	Matches one character
[kxw]	Matches k, x, or w
[!kxw]	Matches any character except k, x, or w
[a-z]	Matches any character between a and z

Brace expansion		
<pre>cp myfile.{txt,bak}</pre>	Copy myfile.txt to myfile.bak	
touch myfile_{a,b,c}	Create myfile_a, myfile_b, myfile_c	
touch {ah}	Create 8 files named a b c d e f g h	

In Linux, everything is (displayed as) a file. File descriptors are automatically associated to any process launched.

Piped commands run concurrently 1s > myfile 1s 1> myfile 1s 1> myfile 1s > myfile 1s >> myfile 1s >> myfile 1s >> myfile 1s >> myfile Append the stdout of command 1s to a file, even if noclobber 1s >> myfile Append the stdout of command 1s to a file 1s 1>> myfile Append the stdout of command 1s to a file 1s 2> myfile Append the stdout of command 1s to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1f to a file (i.e. write any error encountered by the command 1s to a file mail root@example.com < myfile Redirect both stdout and stderr of command 1s to a file (i.e. write content of current directory to screen an			Fi	le descriptors

while read -r line; do echo "Hello \$line"; done < myfile Process a text file line by line

Any application/program/script that runs on the system is a process. Signals are used for inter-process communication. Each process has an unique PID (Process ID) and a PPID (Parent Process ID); when a process spawns a child, the process PID is assigned to the child's PPID.

The /sbin/init process, run at bootup, has PID 1. It is the ancestor of all processes and becomes the parent of any orphaned process. It is also unkillable; should it die, the kernel will panic.

When a child process dies, its status becomes EXIT_ZOMBIE and a SIGCHLD is sent to the parent. The parent should then call the wait() system call to read the dead process' exit status and other info; until that moment, the child process remains a zombie.

ps -ef (UNIX options)	
pstree PID	Display all processes in hierarchical format. The process tree is rooted at PID, or at init if PID is omitted
top htop	Monitor processes in realtime
kill -9 1138	Send a signal 9 (SIGKILL) to process 1138, hence killing it
killall -9 sshd	Kill processes whose name is sshd
pgrep -u root sshd	Show processes whose name is sshd and are owned by root Note: pgrep and pkill
pkill -9 -u root ssl	Kill processes whose name is sshd and are owned by root accept the same options
jobs	List all jobs (i.e. processes whose parent is a Bash shell)
CTRL Z	Suspend a job, putting it in the stopped state (send a SIGTSTP)
bg %1	Put job #1 in the background (send a SIGCONT)
fg %1	Resume job #1 in the foreground and make it the current job (send a SIGCONT)
kill %1	Kill job #1

When a Bash shell is terminated cleanly via exit, its jobs will became child of the Bash's parent and will continue running. When a Bash is killed instead, it issues a SIGHUP to his children which will terminate.

```
nohup myscript.sh
```

Prevent a process from terminating (receiving a SIGHUP) when its parent Bash dies

To each process is associated a niceness value: the lower the niceness, the higher the priority. The niceness value ranges from -20 to 19, and a newly created process has a default niceness of 0. Unprivileged users can modify a process' niceness only within the range from 1 to 19.

nice -n -5 <i>command</i>	Start a command with a niceness of -5. If niceness is omitted, a default value of 10 is used
renice -5 <i>command</i>	Change the niceness of a running command to -5
strace command	Trace the execution of a command, intercepting and printing the system calls called by a process and the signals received by a process

Most frequently used signals						
Signal number Signal name Meaning						
1	SIGHUP	Used by many daemons to reload their configuration				
2	SIGINT	Interrupt, stop				
9	SIGKILL	Kill unconditionally (this signal cannot be ignored)				
15	SIGTERM	Terminate gracefully				
18	SIGCONT	Continue execution				
20	SIGTSTP	Stop execution				

- man 7 signal Manual page about signals
- kill -1 List all available signal names
- kill -1 1 Print the name of signal number 1

vmstat

 $\ensuremath{\mathsf{Print}}$ a report about virtual memory statistics: processes, memory, paging, block I/O, traps, disks, and CPU activity

vmstat 1 5

Print a report every second, for 5 times

iostat	Print a report about CPU utilization, device utilization, and network filesystem. The first report shows statistics since the system boot; subsequent reports will show statistics since the previous report
iostat -dx 1 5	Print a detailed report for all devices every second, for 5 times
mpstat	Print a report about processor activities
mpstat 1 5	Print a report of global statistics among all processors every second, for 5 times
top	Process viewer
htop	Process viewer (ncurses UI)
iotop	Display I/O usage by processes in the system
free	Show the amount of free and used memory in the system
uptime	Show how long the system has been up, how many users are connected, and the system load averages for the past 1, 5, and 15 minutes
sar	Show reports about system activity. Reports are generated from data collected via the cron job sysstat and stored in $/var/log/sa/sn$, where n is the day of the month
sar -n DEV	Show reports about network activity (received and transmitted packets per second)
sar -f /var/log/sa/s19 \ -s 06:00:00 -e 06:30:00	Show reports for system activity from 6 to 6:30 AM on the 19^{th} of the month

powertop

Power consumption and power management diagnosis tool

	Linux monitoring tools
collectd	System statistics collector
Nagios	System monitor and alert
MRTG	Network load monitor
Cacti	Network monitor

	Regular expressions
^	Beginning of a line
\$	End of a line
\< \>	Word boundaries (beginning of line, end of line, space, or punctuation mark)
	Any character, except newline
[abc]	Any of the characters specified
[a-z]	Any of the characters in the specified range
[^abc]	Any character except those specified
*	Zero or more times the preceding regex
+	One or more times the preceding regex
?	Zero or one time the preceding regex
{5}	Exactly 5 times the preceding regex
{3,6}	Between 3 and 6 times the preceding regex
1	The regex either before or after the vertical bar
()	Grouping, to be used for back-references. $\ \ 1$ expands to the first match, $\ 2$ for the second, and so on until $\ 9$

Permission	Octal value	Command	Effect on file	Effect on directory		
	user: 400	chmod u+r		Can list directory content		
Read	group: 40	chmod g+r	Can open and read the file			
	others: 4	chmod o+r				
	user: 200	chmod u+w				
Write	group: 20	chmod g+w	Can modify the file	Can create, delete, and rename files in the directory		
	others: 2	chmod o+w				
	user: 100	chmod u+x		Can enter the directory, and search files within (by accessing a file's inode)		
Execute	group: 10	chmod g+x	Can execute the file (binary or script)			
	others: 1	chmod o+x				
SetUID (SUID)	4000	chmod u+s	Executable is run with the privileges of the file's owner	No effect		
SetGID (SGID)	2000	chmod g+s	Executable is run with the privileges of the file's group	All new files and subdirectories inherit the directory's group ID		
Sticky	1000	chmod +t	No effect	Only the file's or the directory's owner can delete or rename a file inside		

chmod 710 <i>file</i> chmod u=rwx,g=x <i>file</i>	Set read, write, and execute permission to user; set execute permission to group
chmod 660 <i>file</i> chmod ug=rw <i>file</i>	Set read and write permission to user and group
chmod +wx file	Add write and execute permission to everybody (user, group, and others)
chmod -R o+r file	Add recursively read permission to others
chmod o-x file	Remove execute permission from others
chown root file	Change the owner of file to root
chown root:mygroup file	Change the owner of file to root, and the group of file to mygroup
chgrp mygroup file	Change the group of file to mygroup

The chmod, chown, and chgrp commands accept the option -R to recursively change properties of files and directories.

umask 022Set the permission mask to 022, hence masking write permission for group and others.umask 022Linux default permissions are 0666 for files and 0777 for directories. These base permissions are
ANDed with the inverted umask value to calculate the final permissions of a new file or directory.

chattr +mode file	Add a file or directory attribute
chattr -mode file	Remove a file or directory attribute
chattr =mode file	Set a file or directory attribute, removing all other attributes
lsattr <i>file</i>	List file or directory attributes

Mode Effect

Mode	Effect
a	File can only be open in append mode for writing
A	When file is accessed, its atime record is not modified
с	File is automatically compressed on-the-fly on disk by the kernel
С	File is not subject to copy-on-write updates (only for filesystems which perform copy-on-write)
d	File will not be backed up by the dump program
D	When directory is modified, changes are written synchronously on disk (equivalent to dirsync mount option)
e	File is using extents for mapping the blocks on disk
Е	Compression error on file (attribute is used by experimental compression patches)
h	File is storing its blocks in units of filesystem blocksize instead of in units of sectors, and was larger than 2 Tb
i	File is immutable: cannot be modified, linked, or changed permissions
I	Directory is being indexed using hashed trees
j	All file data is written to the ext3 or ext4 journal before being written to the file itself
Ν	File has data stored inline within the inode itself
s	File will be securely wiped by zeroing when deleted
S	When file is modified, changes are written synchronously on disk (equivalent to $sync$ mount option)
t	File won't have EOF partial block fragment merged with other files (only for filesystems supporting tail-merging)
Т	Directory is the top of directory hierarchies for the purpose of the Orlov block allocator
u	After file is deleted, it can be undeleted
х	Raw contents of compressed file can be accessed directly (attribute is used by experimental compression patches)

Z Compressed file is dirty (attribute is used by experimental compression patches)
A Linux directory contains a list of structures which are associations between a filename and an inode. An inode contains all file metadata: file type, permissions, owner, group, size, access/change/modification/deletion times, number of links, attributes, ACLs, and address where the actual file content (data) is stored. An inode does not contain the name of the file; this information is stored in the directory the file is in.

- ls -i Show a listing of the directory with the files' inode numbers
- df -i Report filesystem inode usage

	Hard link	Symbolic or soft link
Definition	A link to an already existing inode	A path to a filename; a shortcut
Command to create it	ln myfile hardlink	ln -s myfile symlink
Is the link still valid if the original file is moved or deleted?	Yes (because the link references the inode the original file pointed to)	No (the path now references a non- existent file)
Can link to a file in another filesystem?	No (because inode numbers make sense only within a determinate filesystem)	Yes
Can link to a directory?	No	Yes
Link permissions	Reflect the original file's permissions, even when these are changed	rwxrwxrwx
Link attributes	- (regular file)	1 (symbolic link)
Inode number	The same as the original file	A new inode number

find / -name "foo*"	Find all files, starting from the root dir, whose name start with foo
find / -name "foo*" -print	Find all files whose name start with foo and print their path
find / -name "foo*" -exec chmod 700 {} \;	Find all files whose name start with foo and apply permission 700 to all of them
find / -name "foo*" -ok chmod 700 {} \;	Find all files whose name start with foo and apply permission 700 to all of them, asking for confirmation before each file
find / -perm -4000 -type f	Find all files with SUID set (a possible security risk, because a shell with SUID root is a backdoor)
find / -perm -2000 -type f	Find all files with SGID set
locate ls slocate ls	Locate the command ls by searching the file index, not by actually walking the filesystem. The search is quick but will only held results relative to the last rebuilding of the file index (/etc/updatedb.conf)
updatedb	Build the file index (/etc/updatedb.conf)
which command	Locate a binary executable command within the PATH
which -a command	Locate all matches of command, not only the first one
whereis command	Locate the binary, source, and manpage files for command
whereis -b command	Locate the binary files for command
whereis -s command	Locate the source files for command
whereis -m command	Locate the manpage files for command
file myfile	Analyze the content of a file or directory
type command	Determine if command is a program or a builtin (i.e. a feature internal to the shell)

Bash shell event	Files run		
When a login shell is launched	/etc/profile ~/.bash_profile ~/.bash_login ~/.profile	The shell executes the system-wide profile file, then the first of the 3 user files that exists and is readable	
When a login shell exits	~/.bash_logout		
When a non-login shell is launched	<pre>/etc/bash.bashrc /etc/bashrc ~/.bashrc</pre>		

MYVAR=value ((MYVAR=value))	Set a variable
<pre>MYVAR=\$((MYVAR+1)) ((MYVAR=MYVAR+1)) ((MYVAR+=1)) ((MYVAR++)) let "MYVAR=MYVAR+1" let "MYVAR+=1" let MYVAR++</pre>	Increment a numeric variable
unset MYVAR	Delete a variable
export MYVAR	Export a variable so it can be seen by Bash child processes
set \${MYVAR:= <i>value</i> } MYVAR=\${MYVAR:- <i>value</i> }	Set a variable, if it is not already set (i.e. does not exist) or is null
echo \$MYVAR	Print the value of a variable
echo \${MYVAR:-message}	If variable exists and is not null, print its value, otherwise print a message
<pre>echo \${MYVAR:+message}</pre>	If variable exists and is not null, print a message, otherwise print nothing
echo \$((3+3))	Evaluate an expression and print the result
set	Display all Bash variables
set -o	Show the status of all Bash options
set -option set -o long_option	Enable a Bash option
set +option set +o long_option	Disable a Bash option
set -v set -o verbose	Enable printing of shell input lines as they are read
set -x set -o xtrace	Enable printing of command traces before execution of each command
env	Display all environment variables
typeset -f	Show functions defined in the current Bash session
alias ls='ls -lap'	Set up an alias for the ls command
alias	Show defined aliases
\ls /bin/ls	Run the non-aliased version of the ls command

Scripts must start with the shebang line #!/bin/bash indicating the location of the script interpreter.

		Script execution		
<pre>source myscript.sh . myscript.sh bash myscript.sh ./myscript.sh (file must be executable)</pre>		Script execution takes place in the same shell. Variables defined and exported in the script are seen by the shell when the script exitsScript execution spawns a new shell		
command1; command2	Execute co	mmand 1 and then command 2		
ommand1 && command2	Execute co	mmand 2 only if command 1 executed successfully (exit status = 0)		
command1 command2	Execute co	mmand 2 only if command 1 did not execute successfully (exit status > 0		
command1 && command2)	Group com	Group commands together for evaluation priority		
exit	Terminate	a script		
exit n		Terminate a script with the specified exit status number n . By convention, a 0 exit status is used if the script executed successfully, non-zero otherwise		
if [\$? -eq 0] then echo "Success" else Evaluate		hether the last executed command exited successfully or failed		
echo "Fail" i				
Eunction myfunc { commands } nyfunc() { commands }	Define a fu	nction		
nyfunc argl arg2	Call a function			
MYVAR=`date` MYVAR=\$(date)	Assign to a	variable the output resulting from a command		
For DIR in `ls` do rmdir \$DIR done	Loop throug	gh a list of directories		
Display GTK+ graphical dialogs for user messages and input		K+ graphical dialogs for user messages and input		
command ts	Prepend a t	timestamp to each line of a command's output		
		Bash built-in variables		
\$0	Script	t name		
\$ <i>n</i>	<i>n</i> th a	rgument passed to the script or function		
\$#	Numb	per of arguments passed to the script or function		
\$?	Exit s	tatus of the last executed command		

Exit status of the *n*th command in the executed pipeline

PID of the script in which this variable is called

\${PIPESTATUS[n]}

\$\$

test \$MYVAR = "value" && command [\$MYVAR = "value"] && command if [\$MYVAR = "value"]; then command; fi

Test operators					
Integer opera	itors	File opera	ators	Expressio	on operators
-eq	Equal to	-e or -a	Exists	-a	Logical AND
-ne	Not equal to	-d	Is a directory	-0	Logical OR
-lt	Less than	-b	Is a block special file	!	Logical NOT
-le	Less than or equal to	-c	Is a character special file	$\setminus (\setminus)$	Priority
-gt	Greater than	-f	Is a regular file		
-ge	Greater than or equal to	-r	Is readable		
String operat	ors	-w	Is writable		
- z	Is zero length	-x	Is executable		
-n or nothing	Is non-zero length	-s	Is non-zero length		
= or ==	Is equal to	-u	Is SUID		
! =	Is not equal to	-g	Is SGID		
<	Is alphabetically before	-k	Is sticky		
>	Is alphabetically after	-h	Is a symbolic link		

expr \$MYVAR = "39 + 3"	Evaluate an expression (i.e. the variable will hold the value 42)
expr string : regex	Return the length of the substring matching the regex
<pre>expr string : \(regex\)</pre>	Return the substring matching the regex

Evaluation operators					
=	Equal to	+	Plus	string : regex	String matches regex
! =	Not equal to	-	Minus	match string regex	String matches regex
<	Less than	*	Multiplied by	substr string pos length	Substring
<=	Less than or equal to	/	Divided by	index string chars	Index of any chars in string
>	Greater than	90	Remainder	length string	String length
>=	Greater than or equal to				

	Tests
<pre>if [test 1] then [command block 1] elif [test 2] then [command block 2] else [command block 3] fi</pre>	<pre>case \$VAR in [pattern 1]) [command 1] ;; [pattern 2]) [command 2] ;; *) [command 3] esac</pre>

	Loops		
while [test]	for I in [list]	break	Terminate a loop
do [command block] done	do [command operating on \$1] done	continue	Jump to the next iteration

Text processors

vi	Vi, text editor
vim	Vi Improved, an advanced text editor
vimdiff file1 file2	Compare two text files
pico	Pico, simple text editor
nano	Nano, simple text editor (GNU clone of Pico)
emacs	GNU Emacs, a GUI text editor
more	Text pager (obsolete)
less	Text pager

	less pager commands
h	Help
g	Go to first line in the file
G	Go to last line in the file
F	Print the end of the file, moving forward as the file grows
-N	Show line numbers
-n	Don't show line numbers
=	Show information about the file
q	Quit

ESC	Go to Command mode					
i	Insert text before cursor					
I	Insert text after line					
a	Append text after cursor	and go to Insert mode				
А	Append text after line					
W	Move to next word	\$	Move to end of line			
b	Move to beginning of word	1G	Move to beginning of file i.e. to line 1			
е	Move to end of word	G	Move to end of file			
0	Move to beginning of line	Z RETURN	Make current line the top line of the screen			
CTRL G	Show current line and colum	in number				
ΥΥ	Copy current line					
р	Paste buffer after current lin	e				
Р	Paste buffer before current l	ine				
уур	Duplicate current line					
х	Delete current character					
Х	Delete before current character					
D	Delete from current character to end of line					
dd	Delete current line					
7dd	Delete 7 lines (almost any co	ommand can be prepended	d by a number to repeat it a number of times)			
u	Undo last command (Vi can	undo the last command or	nly, Vim is able to undo several commands)			
	Repeat last text-changing command					
/string	Search for string forward	n	Search for next match of string			
?string	Search for <i>string</i> backwards	Ν	Search for previous match of string			
:5,40s/^/#/	Add a hash character at the	beginning of each line, fro	m line 5 to 40			
!!program	Replace line with output fror	n <i>program</i>				
:r file	Read file and insert it after current line					
: X	Encrypt current document (when opening it again, Vi will prompt for the key to encrypt it)					
:w file	Write to <i>file</i>					
:wq	Save changes and quit					
:d	Quit (only if there are no cha	anges)				
:q!	Abandon all changes and qu					

Vi options

Option	Effect
ai	Turn on auto indentation
all	Print all option to screen
ap	Print line after commands d c J m :s t u
aw	Automatic write on commands :n ! e# ^^ :rew ^} :tag
bf	Discard control characters from input
dir=tmpdir	Set <i>tmpdir</i> as directory for temporary work files
eb	Precede error messages with a bell
ht=8	Set terminal tab as 8 spaces
ic	Ignore case when searching
lisp	Modify brackets for Lisp compatibility
list	Show tabs and end-of-line characters
magic	Allow pattern matching with special characters
mesg	Enable UNIX terminal messaging
nu	Show line numbers
opt	Speeds output by eliminating automatic Return
para=LI1PLPPPQPbpP	Set macro to start paragraphs for { } operators
prompt	Prompt : for command input
re	Simulate smart terminal on dumb terminal
remap	Accept macros within macros
report	Show largest size of changes on status line
ro	Make file readonly
scroll=11	Set screen size as 11 lines
sh=/bin/bash	Set shell escape to /bin/bash
showmode	Show current mode on status line
slow	Postpone display updates during inserts
sm	Show matching parentheses when typing
sw=8	Set shift width to 8 characters
tags=/usr/lib/tags	Set path for files checked for tags
term	Print terminal type
terse	Print terse messages
timeout	Eliminate 1-second time limit for macros
tl=3	Set significance of tags beyond 3 characters $(0 = all)$
ts=8	Set tab stops to 8 for text input
wa	Inhibit normal checks before write commands
warn	Warn "No write since last change"
window=24	Set text window as 24 lines
wm=0	Set automatic wraparound 0 spaces from right margin
:set option turn on	an option

:set option turn on an option :set nooption turn off an option

Options can also be set permanently by including them in $\scriptstyle \sim/. \tt exrc$

SHOW DATABASES;	Show all existing databases
SHOW TABLES;	Show all tables from the selected database
USE CompanyDatabase;	Choose which database to use
SELECT DATABASE();	Show which database is currently selected
CREATE TABLE customers (cusid INT NOT NULL AUTO_INCREMENT PRIMARY KEY, firstname VARCHAR(32), lastname VARCHAR(32), dob DATE, city VARCHAR(24), zipcode VARCHAR(5));	Create tables
CREATE TABLE payments (payid INT NOT NULL AUTO_INCREMENT PRIMARY KEY, date DATE, fee INT, bill VARCHAR(128), cusid INT, CONSTRAINT FK1 FOREIGN KEY (cusid) REFERENCES customers(cusid));	
CREATE INDEX lastname_index ON customers(lastname); ALTER TABLE customers ADD INDEX lastname_index (lastname);	Create a field index for fast search
DESCRIBE customers;	Describe the columns of a table
DROP TABLE payments;	Delete a table
DROP DATABASE CompanyDatabase;	Delete a database
ALTER TABLE customers MODIFY city VARCHAR(32);	Modify the type of a field
INSERT INTO customers (firstname,lastname,dob) VALUES ('Arthur','Dent',1959-08-01), ('Trillian','',1971-03-19);	Insert a new record in a table
DELETE FROM customers WHERE firstname LIKE 'Zaphod';	Delete some records in a table
UPDATE customers SET city = 'London' WHERE zipcode = '00789';	Modify data
CREATE VIEW cust_view AS SELECT * FROM customers WHERE city != 'London';	Create a view
Similar filler and a some of the second seco	
COMMIT;	Commit changes to the database
ROLLBACK;	Rollback the current transaction, canceling any changes done during it
START TRANSACTION; BEGIN;	Disable autocommit for this transaction, until a COMMIT or ROLLBACK is issued

SQL SELECTs

SELECT * FROM customers; Select all columns from the customers table SELECT firstname, lastname FROM customers LIMIT 5; Select first and last name of customers, showing 5 records only SELECT firstname, lastname FROM customers WHERE zipcode = '00123'; Select first and last name of customers whose zip code is 00123 SELECT firstname, lastname FROM customers WHERE zipcode IS NOT NULL; Select first and last name of customers with a recorded zip code SELECT * FROM customers ORDER BY lastname, firstname; Select customers in alphabetical order by last name, then first name SELECT * FROM customers ORDER by zipcode DESC; Select customers, sorting them by zip code in reverse order SELECT firstname, lastname, TIMESTAMPDIFF(YEAR, dob, CURRENT DATE) as AGE Select first name, last name, and FROM customers; calculated age of customers SELECT DISTINCT city FROM customers; Show all cities but retrieving each unique output record only once SELECT city, COUNT(*) FROM customers GROUP BY city; Show all cities and the number of customers in each city. NULL values are not counted SELECT cusid, SUM(fee) FROM payments GROUP BY cusid; Show all fee payments grouped by customer ID, summed up SELECT cusid, AVG(fee) FROM payments GROUP BY cusid Show the average of fee payments HAVING AVG(fee) <50; grouped by customer ID, where this average is less than 50 SELECT MAX(fee) FROM payments; Show the highest fee in the table SELECT cusid FROM payments t1 WHERE fee = Show the customer ID that pays the (SELECT MAX(t2.fee) FROM payments t2 WHERE t1.cusid=t2.cusid); highest fee (via a subquery) SELECT @maxfee:=MAX(fee) FROM payments; Show the customer ID that pays the SELECT cusid FROM payments t1 WHERE fee = @maxfee; highest fee (via a user set variable) SELECT cusid FROM payments WHERE fee > Show the customer IDs that pay ALL (SELECT fee FROM payments WHERE cusid = 4242001; fees higher than the highest fee paid by customer ID 4242001 SELECT * FROM customers WHERE firstname LIKE 'Trill%'; Select customers whose first name starts with "Trill" SELECT * FROM customers WHERE firstname LIKE 'F rd'; Select matching customers; the matches a single character SELECT * FROM customers WHERE firstname REGEXP '^Art.*r\$'; Select customers whose first name matches the regex SELECT firstname, lastname FROM customers WHERE zipcode = '00123' Select customers that satisfy any of UNTON the two requirements SELECT firstname, lastname FROM customers WHERE cusid > 4242001; SELECT firstname, lastname FROM customers WHERE zipcode = '00123' Select customers that satisfy both INTERSECT of the two requirements SELECT firstname, lastname FROM customers WHERE cusid > 4242001; SELECT firstname, lastname FROM customers WHERE zipcode = '00123'

Select customers that satisfy the first requirement but not the second

SELECT firstname, lastname FROM customers WHERE cusid > 4242001;

EXCEPT

SELECT customers.lastname, payments.bill FROM customers, payments WHERE customers.cusid = payments.cusid;

SELECT customers.lastname, payments.bill FROM customers NATURAL JOIN payments;

SELECT customers.lastname, payments.bill
FROM customers JOIN payments USING (cusid);

SELECT customers.lastname, payments.bill FROM customers JOIN payments ON customers.cusid = payments.cusid;

SELECT * FROM customers CROSS JOIN payments;

SELECT customers.lastname, payments.bill FROM customers LEFT JOIN payments ON customers.cusid = payments.cusid;

SELECT customers.lastname, payments.bill
FROM customers RIGHT JOIN payments ON customers.cusid = payments.cusid;

Perform a join (aka inner join) of

a relationship

two tables to select data that are in

Perform a Cartesian product (aka cross join) of two tables

Perform a left join (aka left outer join) of two tables, returning records matching the join condition and also records in the left table with unmatched values in the right table

Perform a right join (aka right outer join) of two tables, returning records matching the join condition and also records in the right table with unmatched values in the left table

SELECT Host,User FROM mysql.user;	List MySQL users
CREATE USER 'john'@'localhost' IDENTIFIED BY 'p4ssw0rd';	Create a MySQL user, setting his password
DROP USER 'john'@'localhost';	Delete a MySQL user
<pre>SET PASSWORD FOR 'john'@'localhost' = PASSWORD('p4ssw0rd');</pre>	Set a password for a MySQL user
<pre>SET PASSWORD FOR 'john'@'localhost' = '*7E684A3DF6273CD1B6DE53';</pre>	Set a password for a MySQL user, specifying its hash instead of the plaintext
SHOW GRANTS FOR 'john'@'localhost';	Show permissions for a user
GRANT ALL PRIVILEGES ON MyDatabase.* TO 'john'@'localhost';	Grant permissions to a user
REVOKE ALL PRIVILEGES FROM 'john'@'localhost';	Revoke permissions from a user
<pre>GRANT SELECT ON *.* TO 'john'@'localhost' IDENTIFIED BY 'p4ssw0rd';</pre>	Create a MySQL user and set his grants
FLUSH PRIVILEGES;	Reload and commit the grant tables; to be used after any GRANT command
USE MyDatabase; SOURCE mydbbak.sql;	Restore a database from a dump file
USE MyDatabase; LOAD DATA LOCAL INFILE 'foofile' INTO TABLE foo;	Populate a table with data from file (one record per line, values separated by tabs)
SELECT * FROM MyDatabase.mytable; SELECT * FROM MyDatabase.mytable\g	Send a statement to the server
SELECT * FROM MyDatabase.mytable\G	Display result in vertical format, showing each record in multiple rows
<pre>SELECT /*!99999 my comment*/ * FROM MyDatabase.mytable;</pre>	Insert a comment in the statement
\s	Print status information about the server and the current connection
\c	Cancel current input
SELECT VERSION();	Show version of MySQL server
SELECT CURDATE(); SELECT CURRENT_DATE;	Show current date
SELECT CURTIME(); SELECT CURRENT_TIME;	Show current time
SELECT NOW();	Show current date and time
SELECT USER();	Show current logged-in user@host
\! command	Run a shell command
TEE logfile	Log all I/O of the current MySQL session to the specified logfile

SHOW VARIABLES; SHOW SESSION VARIABLES; SHOW LOCAL VARIABLES;	Print session variables (affecting the current connection only)
SHOW GLOBAL VARIABLES;	Print global variables (affecting the global operations on the server)
SHOW VARIABLES LIKE 'sort_buffer_size';	Print session variables that match the given pattern
<pre>SET sort_buffer_size=10000; SET SESSION sort_buffer_size=10000; SET LOCAL sort_buffer_size=10000; SET @@sort_buffer_size=10000; SET @@session.sort_buffer_size=10000; SET @@local.sort_buffer_size=10000;</pre>	Set a session variable
<pre>SET GLOBAL sort_buffer_size=10000; SET @@global.sort_buffer_size=10000;</pre>	Set a global variable
SHOW STATUS; SHOW SESSION STATUS; SHOW LOCAL STATUS;	Print session status (concerning the current connection only)
SHOW GLOBAL STATUS;	Print global status (concerning the global operations on the server)
SHOW WARNINGS;	Print warnings, errors and notes resulting from the most recent statement in the current session that generated messages
SHOW ERRORS;	Print errors resulting from the most recent statement in the current session that generated messages
SHOW TABLE STATUS;	Print information about the database e.g. engine (InnoDB or MyISAM), rows, indexes, data
SHOW ENGINE INNODE STATUS;	Print statistics concerning the InnoDB engine
SHOW FULL PROCESSLIST;	Print the list of threads running on the system
SELECT table_schema "Name", sum(data_length+index_length)/1024 "Size Kb" FROM information_schema.TABLES GROUP BY table_schema;	Display the sizes of all databases in the system

MySQL tools

mysqld safe

mysql_install_db (deprecated)
mysqld --initialize

mysql_secure_installation

mysql -u root -p mysql -u root -ps3cr3t mysql -u root -p -e 'CREATE DATABASE MyDatabase'

mysqldump -u root -p --all-databases > alldbsbak.sql
mysqldump -u root -p MyDatabase > mydbbak.sql
mysql -u root -p < alldbsbak.sql
mysql -u root -p MyDatabase < mydbbak.sql</pre>

mysql_upgrade -u root -p

mysqlcheck [options]

mysqlcheck --check db table
mysqlcheck --check --databases db1 db2
mysqlcheck --check --all-databases

mysqltuner.pl

Start the MySQL server (mysqld) with safety features such as restarting the server if errors occur and logging runtime information to the error logfile. Recommended

Initialize the MySQL data directory, create system tables, and set up an administrative account

Set password for root, remove anonymous users, disable remote root login, and remove test database

Login to MySQL as root and prompt for the password Login to MySQL as root with password s3cr3t Run a SQL command via MySQL

Backup all databases to a dump file Backup a database to a dump file Restore all databases from a dump file Restore a database from a dump file

Check all tables in all databases for incompatibilities with the current version of $\ensuremath{\mathsf{MySQL}}$

Perform table maintenance. Each table is locked while is being processed. Options are:

check	Check table for errors (default)			
analyze	Analyze table			
optimize	Optimize table			
repair	Repair table; this can fix almost anything except unique keys that are not unique			
Check the specified table of the specified database				

check the specified table of the specified da

Check the specified databases

Check all databases

Review the current MySQL installation for performances and stability $% \left({{{\rm{S}}_{{\rm{s}}}}_{{\rm{s}}}} \right)$

X Window

	Display Managers				
Display Manager		Config	Display Manager greeting screen		
xdm	X Display Manager	/etc/x11/xdm/Xaccess	Control inbound requests from remote hosts		
		/etc/x11/xdm/Xresources	Configuration settings for X applications and the login screen		
		/etc/x11/xdm/Xservers	Association of X displays with local X server software, or with X terminals via XDMCP	Defined in /etc/x11/xdm/Xresources by the line:	
		/etc/x11/xdm/Xsession	Script launched by xdm after login	xlogin*greeting: \ Debian GNU/Linux (CLIENTHOST)	
		/etc/x11/xdm/Xsetup_0	Script launched before the graphical login screen		
		/etc/x11/xdm/xdm-config	Association of all xdm configuration files		
gdm	GNOME Display Manager	/etc/gdm/gdm.conf Or /etc/gdm/custom.conf		Configured via gdmsetup	
kdm	KDE Display Manager	isplay /etc/kde/kdm/kdmrc		Configured via kdm_config	

/etc/init.d/xdm start
/etc/init.d/gdm start
/etc/init.d/kdm start

/etc/init.u/kum start	
xorgconfig (Debian) Xorg -configure (Red Hat)	Configure X (text mode)
xorgcfg (Debian) system-config-display (Red Hat)	Configure X (graphical mode)
X -version	Show which version of X is running
xdpyinfo	Display information about the X server
xwininfo	Display information about windows
xhost + 10.3.3.3 xhost - 10.3.3.3	Add or remove 10.3.3.3 to the list of hosts allowed to make X connections to the local machine
switchdesk gde	Switch to the GDE Display Manager at runtime
/etc/X11/xorg.conf	Configuration file for X
~/.Xresources	Configuration settings for X applications, in the form program*resource: value
\$DISPLAY	Environment variable defining the display name of the X server, in the form <pre>hostname:displaynumber.screennumber</pre>

Start the X Display Manager

/etc/inittab instructs init to launch XDM at runlevel 5: x:5:res

/etc/sysconfig/desktop defines GNOME as the default
Display Environment and Display Manager:

x:5:respawn:/usr/X11R6/bin/xdm -nodaemon

desktop="gde" displaymanager="gdm"

xdotool	X automation tool
xdotool getwindowfocus	Get the ID of the currently focused window (usually the terminal where this command is typed)
xdotool selectwindow	Pop up a X cursor and get the ID of the window selected by it
xdotool keywindow 12345678 Return	Simulate a Return keystroke inside window ID 12345678
xprop	X property displayer
xrandroutput eDP1right-of VGA1	Extend the screen on an additional VGA physical screen situated to the left
xsel	Manipulate the X selection (primary, secondary, and clipboard)
xsel -b < file	Put the contents of a file in the X clipboard
XSEI -D < IIIE	
xsel -b -a < file2	Append the contents of a file to the X clipboard
xsel -b -a < file2	Append the contents of a file to the X clipboard
xsel -b -a < file2 xsel -b -o	Append the contents of a file to the X clipboard Output onscreen the contents of the X clipboard
xsel -b -a < file2 xsel -b -o mkfontdir	Append the contents of a file to the X clipboard Output onscreen the contents of the X clipboard Catalog the newly installed fonts in the new directory Dynamically add the new installed fonts in /usr/local/fonts to the X

This is an excerpt of keysymdef.h which defines keysym codes (i.e. characters or functions associated with each key in X11) as XK_key and the key hex value. These keys can be used as argument for the xdotool key command.

/etc/passwd User accounts

6

root:x:0:0:/root:/bin/bash

bin:x:1:1:/bin:/bin/bash

5

4

jdoe:x:500:100:John Doe,,555-1234,,:/home/jdoe:/bin/bash

1 2 3

1 Login name

- 2 Encrypted password (obsolete), or x if password is in /etc/shadow
- 3 UID User ID (UID 0 is superuser; by convention UIDs 1-99 are system accounts, UIDs above are regular users)
- 4 GID Default Group ID
- 5 GECOS field Information about the user: Full name, Room number, Work phone, Home phone, Other
- 6 Home directory of the user
- 7 Login shell (can be set to /bin/false to prevent a user from logging in)

/etc/shadow User passwords (readable only by root) root:fZPe54/Kldu6D32pl0X/A:15537:0:99999:7::: bin:*:15637:0:99999:7::: jdoe:!hsp\8e3jCUdw9Ru53:15580:0:99999:7::15766: 1 2 3 4 5 678 9 1 Login name 2 Encrypted password (a ! prefix if the account is locked, * if account is disabled, ! or !! if no password) 3 Date of last password change (in number of days since 1 January 1970) 4 Days before password may be changed; if 0, user can change the password at any time Days after which password must be changed 5 6 Days before password expiration that user is warned 7 Days after password expiration that account is disabled 8 Date of account disabling (in number of days since 1 January 1970) 9 Reserved field

/etc	/group	Group accounts
root:x:0:root	1	Group name
jdoe:x:501	2	Encrypted password, or ${\tt x}$ if password is in /etc/gshadow
<pre>staff:x:530:jdoe,asmith</pre>	3	GID - Group ID
1 2 3 4		

4

	/etc/gshadow Group p	assw	vords (readable only by root)
root::root:root		1	Group name
jdoe:!::		2	Encrypted password, or ! if no password set (default)
<pre>staff:0cfz7IpLhW19i::root,jdoe</pre>		3	Group administrators
1 2	3 4	4	Group members

Group members (if this is not their Default Group)

User management

useradd -m jdoe	Create a user account, creating and populating his homedir from ${\tt /etc/skel}$		
useradd -mc "John Doe" jdoe	Create a user account, specifying his full name		
useradd -ms /bin/ksh jdoe	Create a user account, specifying his login shell		
useradd -D	Show default values (specified in ${\tt /etc/login.defs})$ for user account creation		
usermod -c "Jonas Doe" jdoe	Modify the GECOS field of a user account (usermod accepts many		
usermod -L jdoe	Lock a user account useradd options)		
usermod -U jdoe	Unlock a user account		
userdel -r jdoe	Delete a user and his homedir		
chfn jdoe	Change the GECOS field of a user		
chsh jdoe	Change the login shell of a user		
passwd jdoe	Change the password of a user		
passwd -l jdoe	Lock a user account		
passwd -S jdoe	Get information about a user account. Prints username, account status (L=locked, P=password, NP=no password), date of last password change, min age, max age, warning period, inactivity period in days		
chage -E 2013-02-14 jdoe	Change the password expiration date, locking the account at that date		
chage -d 13111 jdoe	Change the date (in number of days since 1 January 1970) of last password change		
chage -d 0 jdoe	Force the user to change password at his next login		
chage -M 30 jdoe	Change the max number of days during which a password is valid		
chage -m 7 jdoe	Change the min number of days between password changes		
chage -W 15 jdoe	Change the number of days before password expiration that the user will be warned		
chage -I 3 jdoe	Change the number of days after password expiration before the account is locked		
chage -l jdoe	List password aging information for a user		
groupadd staff	Create a group		
groupmod -n newstaff staff	Change a group name		
groupdel staff	Delete a group		
gpasswd staff	Set or change the password of a group		
gpasswd -a jdoe staff	Add a user to a group		
gpasswd -d jdoe staff	Delete a user from a group		
gpasswd -A jdoe staff	Add a user to the list of administrators of the group		
adduser deluser (Debian) delgroup	User-friendly front-ends for user and group management		

© Daniele Raffo www.crans.org/~raffo

The Linux Standard Base Core Specification specifies that UIDs from 0 to 99 should be statically allocated by the system and not be created by applications, and UIDs from 100 to 499 should be reserved for dynamic allocation by system administrators and post install scripts. User account UIDs start from 500 (Red Hat) or 1000 (SUSE, Debian).

A process has an effective, saved, and real UID and GID:

Effective UID	Used for most access checks, and as the owner for files created by the process. An unprivileged process can change its effective UID only to either its saved UID or its real UID.
Saved UID	Used when a process running with elevated privileges needs to temporarily lower its privileges. The process changes its effective UID (usually root) to a unprivileged one, and its privileged effective UID is copied to the saved UID. Later, the process can resume its elevated privileges by resetting its effective UID back to the saved UID.
Real UID	Used to identify the real owner of the process and affect the permissions for sending signals. An unprivileged process can signal another process only if the sender's real or effective UID matches the receiver's real or saved UID. Child processes inherit the credentials from the parent, so they can signal each other.
/etc/nologin	If this file exists, login and sshd deny login to the system. Useful to prevent users to log in when doing system maintenance
/etc/login.defs	Definition of default values (UID and GID ranges, mail directory, account validity, password encryption method, and so on) for user account creation
whoami	Print your effective UID
id <i>user</i>	Print real and effective UID and GID of the user
who	Print the list of users logged into the system
Ŵ	Print the list of users logged into the system, and what they are doing
last	Print the list of users that logged in and out. Searches through the file $\type{var/log/wtmp}$
lastb	Print the list of bad login attempts. Searches through the file $\ensuremath{/var/log/btmp}$
fail2ban	Scan authentication logs and temporarily ban IP addresses (via firewall rules) that have too many failed password logins
/var/log/auth.lo	g Logfile containing user logins and authentication mechanisms
/var/log/pwdfail	Logfile containing failed authentication attempts

gksudo -u root gparted

runuser -u jdoe <i>command</i>	Run a command as user jdoe. Can be launched only by the superuser
su jdoe	Run a shell as user jdoe. If user is not specified, assume root
su -c "fdisk -l"	Pass a single command to the shell
su - su -l	Ensure that the spawned shell is a login shell, hence running login scripts and setting the correct environment variables. Recommended option
sudo fdisk -l sudo -uroot fdisk -l	Run a command as root. Sudo commands are logged via syslog on /var/log/auth.log (Debian) or /var/log/secure (Red Hat)
sudo !!	Run again the last command, but this time as root
sudoedit /etc/passwd sudo -e /etc/passwd	Edit a protected file. It is recommended to use this instead of allowing users to sudo text editors as root, which will cause security problems if the editor spawns a shell
visudo	Edit $/\texttt{etc/sudoers}$, the configuration file that specifies access rights to sudo
gksu -u root -l	GUI front-ends to su and sudo used to run a X Window command as root. Will pop up

a requester prompting the user for root's password

write jdoe	Write interactively a message to the terminal of user jdoe (must be logged in)
wall	Write interactively a message to the terminal of all logged in users
echo "Hello" write jdoe	Write a message to the terminal of user jdoe (must be logged in)
echo "Hello" wall	Write a message to the terminal of all logged in users
talk jdoe	Open an interactive chat session with user jdoe (must be logged in)
mesg y chmod g+w \$(tty)	Allow the other users to message you via write, wall, and talk
mesg n chmod g-w \$(tty)	Disallow the other users to message you via write, wall, and talk
mesg	Display your current message permission status

 $\tt mesg$ works by enabling/disabling the group write permission of your terminal device, which is owned by system group $\tt tty.$ The superuser is always able to message users.

screen	Screen manager that multiplexes a virtua processes. This command creates a screen session; reattach to a remote SSH session lost bed	this is	useful to be able later to
screen -list	Show the list of detached screen sessions	;	
screen -r pid.tty.host screen -r sessionowner/pid.tty.host	Resume a detached screen session		
screen -R	Resume the last detached screen session		
echo \$(tty)	Print your terminal device (e.g. /dev/tty	71,/de	v/pts/1)
/etc/issue	Message to be printed before the login pr codes:	ompt.	Can contain these escape
	\b Baudrate of line	\0	Domain name
	\d Date	\r	OS release number
	\s System name and OS	\t	Time
	\1 Terminal device line	\u	Number of users logged in
	\m Architecture identifier of machine	\U	"n users" logged in
	\n Nodename aka hostname	\v	OS version and build date
/etc/issue.net	Message to be printed before the login pr	ompt o	on a remote session
/etc/motd	Message to be printed after a successful l shell	ogin, t	before execution of the login

cron permits repeated scheduled execution.

If /etc/cron.allow exists, only users listed therein can access the service. If /etc/cron.deny exists, all users except those listed therein can access the service. If none of these files exist, all users can access the service.

Edit your user crontab file

crontab -l
crontab -e -u jdoe
/etc/cron.hourly
/etc/cron.daily
/etc/cron.weekly
/etc/cron.monthly

crontab -e

List the contents of your crontab file Edit the crontab file of another user (command available only to the superuser)

Scripts placed in these directories will be automatically executed with the specified periods

	# m	h	dom	mon	dow	user	command	
	25	6	*	*	1	root	foo.sh	every Monday at 6:25 AM
	*/5	16	*	*	*	root	/opt/myscript.sh	from 4:00 to 4:55 PM every 5 minutes everyday
	0,30	7	25	12	*	jdoe	/home/jdoe/bar.sh	at 7:00 and 7:30 AM on 25 th December
	3	17	*	*	1-5	root	baz.sh	at 5:03 PM everyday, from Monday to Friday
1		minutes						
			hours					
om			day of month (1-31)					
on		month (1-12 or jan-dec)						
w			day of week (0-7 or sun-sat; 0=7=Sunday)					
		User as whom the command will be executed						
ser	mand Command that will be executed at the specified times							

Each user may also set his own crontab scheduling, which will result in a file /var/spool/cron/username. A user' crontab file has the same format, except that the user field is not present.

	/etc/anacrontab					
	<pre># period delay job-identifier command</pre>					
	7	10	cron-weekly	/opt/myscript.sh	If the job has not been run in the last 7 days, wait 10 minutes and then execute the command	
perio	period period, in days, during which the command was not executed					
delay	/	delay to wait, in minutes, before execution of the command				
job-i	identifier job identifier in anacron messages					
comr	mmand command that will be executed					
Anacron jobs are run by crond, and permit the execution of periodic jobs on a machine that is not always powered on, such as a laptop.						

${\tt at}\xspace$ permits scheduled execution once.

If /etc/at.allow exists, only users listed therein can access the service.

If /etc/at.deny exists, all users except those listed therein can access the service.

If none of these files exist, no user except root can access the service.

at 5:00pm tomorrow myscript.sh
at -f mylistofcommands.txt 5:00pm tomorrow
echo "rm file" | at now+2 minutesExecute a command once at the specified time (absolute or relative)at -l
atqList the scheduled jobsat -d 3
atrm 3Remove job number 3 from the list

Localization

Locale environment variables

LANG LANGUAGE	Language, stored in /etc/default/locale. When scripting, LANG=C should be set because this specifies the minimal locale environment for C translation, and guarantees a standard collation and formats for the execution of scripts	
LC_CTYPE	Character classification and case conversion	
LC_NUMERIC	Non-monetary numeric formats	
LC_TIME	Date and time formats	
LC_COLLATE	Alphabetical order	These locale variables are in the format language territory.encoding
LC_MONETARY	Monetary formats	e.g. en_US.UTF-8
LC_MESSAGES	Language and encoding of system messages and user input	The list of supported locales is stored in /usr/share/i18n/SUPPORTED
LC_PAPER	Paper size	
LC_NAME	Personal name formats	
LC_ADDRESS	Geographic address formats	
LC_TELEPHONE	Telephone number formats	
LC_MEASUREMENT	Measurement units (metric or others)	
LC_IDENTIFICATION	Metadata about locale	
LC_ALL	Special variable overriding all others	

locale	Show locale environment variables
locale-gen it_IT.UTF-8	Generate a locale by compiling a list of locale definition files
apt-get install manpages-it language-pack-it	Install a different locale (system messages and manpages)
iconv -f IS6937 -t IS8859 filein > fileout	Convert a text file from a codeset to another

ISO/IEC-8859 is a standard for 8-bit encoding of printable characters. The first 256 characters in ISO/IEC-8859-1 (Latin-1) are identical to those in Unicode. UTF-8 encoding can represent every character in the Unicode set, and was designed for backward compatibility with ASCII.

tzselect tzconfig dpkg-reconfigure tzdata (Debian)

Set the timezone, stored in /etc/timezone

Timezone is also set as a symbolic link from /etc/localtime to the correct timezone file in /usr/share/zoneinfo/

date	Show current date and time
date -d "9999 days ago"	Calculate a date and show it
date -d "1970/01/01 + 4242"	Convert the number of days passed since 1 January 1970 in a canonical date
date +"%F %H:%M:%S"	Show current date in the format specified
date -s "20130305 23:30:00"	Set the date
date 030523302013	Set the date, in the format MMDDhhmmYYYY
ntpd	NTP daemon, keeps the clock in sync with Internet time servers
ntpd -q	Synchronize the time once and quit
ntpd -g	Force NTP to start even if clock is off by more than the panic threshold (1000 secs)
ntpd -n -g -q	Start NTP as a non-daemon, force set the clock, and quit
ntpq -p <i>timeserver</i>	Query the time server for a list of peers
ntpdate timeserver	Synchronizes the clock with the specified time server
ntpdate -b <i>timeserver</i>	Brutally set the clock, without waiting for a slow adjusting
ntpdate -q <i>timeserver</i>	Query the time server without setting the clock
hwclockshow hwclock -r	Show the hardware clock
hwclockhctosys hwclock -s	Set the system time from the hardware clock
hwclocksystohc hwclock -w	Set the hardware clock from system time
hwclockutc	Indicate that the hardware clock is kept in Coordinated Universal Time
hwclocklocaltime	Indicate that the hardware clock is kept in local time

Syslog logging facility:	syslogd	Daemon logging events from user processes
Systog logging facility.	klogd	Daemon logging events from kernel processes

/etc/syslog	g.conf
<pre>facility.level '.info;mail.none;authpriv.none authpriv.* nail.* '.alert '.emerg Local5.* Local7.*</pre>	action /var/log/messages /var/log/secure /var/log/maillog root * @10.7.7.7 /var/log/boot.log

Facility	Level	Destinat	Action
Creator of the message	Severity of the message		ion of the message
auth or security [†] authpriv cron daemon kern lpr mail mark (for syslog internal use) news syslog user uucp local0 local7 (custom)	<pre>emerg or panic[†] (highest) alert crit err or error[†] warning or warn[†] notice info debug (lowest) none (facility disabled)</pre>	filename @hostname user1,user2,user3 *	message is written into a logfile message is sent to a logger server (via UDP port 514) message is sent to users' consoles message is sent to all logged-in users' consoles

† = deprecated

logger -p auth.info " <i>Message</i> "	Send a message to syslogd with the specified facility and priority
man 3 syslog	Syslog manpage listing facilities and levels
logrotate	Rotate logs (by gzipping, renaming, and eventually deleting old logfiles) according to /etc/logrotate.conf
tail -f /var/log/messages less +F /var/log/messages	Print the end of the message log file, moving forward as the file grows (i.e. read logs in real-time)
/var/log/messages /var/log/syslog /var/log/kern.log	System and kernel logfiles
journalctl (Red Hat)	Query the systemd journal (replacement for /var/log/messages)

	Mailbox formats	
	Each mail folder is a single file, storing multiple email messages.	
mbox	Advantages: universally supported, fast search inside a mail folder. Disadvantages: issues with file locking, possible mailbox corruption.	\$HOME/Mail/myfolder
	Each mail folder is a directory, and contains the subdirectories $/cur$, $/new$, and $/tmp$. Each email message is stored in its own file with an unique filename ID.	
Maildir	The process that delivers an email message writes it to a file in the tmp/ directory, and then moves it to new/. The moving is commonly done by hard linking the file to new/ and then unlinking the file from tmp/, which guarantees that a MUA will not see a partially written message as it never looks in tmp/. When the MUA finds mail messages in new/ it moves them to cur/.	\$HOME/Mail/myfolder/
	Advantages: fast location/retrieval/deletion of a specific mail message, no file locking needed, can be used with NFS. Disadvantages: some filesystems may not efficiently handle a large number of small files, searching text inside all mail messages is slow	

SMTP commands			
220 smtp.example.com ESMTP Postfix HELO abc.example.org	HELO	abc.example.org	Initiate the conversation and identify client host to server
250 Hello abc.example.org, glad to meet you MAIL FROM: alice@example.org 250 Ok	EHLO	abc.example.org	Like HELO, but tell server to use Extended SMTP
RCPT TO bob@foobar.com 250 Ok	MAIL	FROM: alice@example.org	Specify mail sender
RCPT TO eve@foobar.com 250 Ok	RCPT	TO: bob@foobar.com	Specify mail recipient
DATA 354 End data with <cr><lf>.<cr><lf></lf></cr></lf></cr>	DATA		Specify data to send. Ended with a dot on a single line
From: Alice <alice@example.org> To: Bob <bob@foobar.com> Cc: Eve <eve@foobar.com></eve@foobar.com></bob@foobar.com></alice@example.org>	QUIT RSET		Disconnect

Some error occurred in the mail server ction was not done. The mail server ran out of system storage nd contained a syntax error or the command line was too long or arguments in the last command contained a syntax error nd is not implemented in the mail server ad was sent out of sequence neters of the last command is not implemented by the server cyou are trying to reach can't be found or you don't have access rights er is not local; part of message text will contain a forwarding address : you are trying to reach has run out of space, try again later is that you specified was not syntactically correct tion has failed for unknown causes

Sendmail is distributed as a monolithic binary file.

It used to run SUID root, which caused many security problems; recent versions run SGID smmsp, the group that has write access on the mail queue. Sendmail uses smrsh, a restricted shell, to run some external programs.

/etc/mail/submit.cf	Sendmail local mail transfer configuration file
/etc/mail/sendmail.cf	Sendmail MTA configuration file
The .cf configuration files are generated from edited .mc text files via the m4 command, e.g. m4 /etc/mail/submit.mc > /etc/mail/submit.cf	

/etc/mail/access.db	Access control file to allow or deny access to systems or users
/etc/mail/local-host-names.db	List of domains that must be considered as local accounts
/etc/mail/virtusertable.db	Map for local accounts, used to distribute incoming email
/etc/mail/mailertable.db	Routing table, used to dispatch emails from remote systems
/etc/mail/domaintable.db	Domain table, used for transitions from an old domain to a new one
/etc/mail/genericstable.db	Map for local accounts, used to specify a different sender for outgoing mail
/etc/mail/genericsdomain.db	Local FQDN

The .db database files are generated from edited text files via the makemap command, e.g. makemap hash /etc/mail/access.db < /etc/mail/access

Run Sendmail in test mode
Print statistics about remote hosts usage
Clear statistics about remote host usage
Print statistics about the mailserver
Display email aliases

Exim is a free MTA, distributed under open source GPL license.

/etc/exim.conf /usr/local/etc/exim/configure	(FreeBSD)	Exim4 configuration file
exinext		Give the times of the next queue run
exigrep		Search through Exim logfiles
exicyclog		Rotate Exim logfiles

Postfix

Postfix is a fast, secure, easy to configure, open source MTA intended as a replacement for Sendmail. It is implemented as a set of small helper daemons, most of which run in a chroot jail with low privileges. The main ones are:

master	Postfix master daemon, always running; starts the other daemons when necessary
nqmgr	Queue manager for incoming and outgoing mail, always running
smtpd	SMTP daemon for incoming mail
smtp	SMTP daemon for outgoing mail
bounce	Manager of bounce messages
cleanup	Daemon that verifies the syntax of outgoing messages before they are handed to the queue manager
local	Daemon that handles local mail delivery
virtual	Daemon that handles mail delivery to virtual users

/var/spool/postfix/incoming	Incoming queue. All new mail entering the Postfix queue is written here by the cleanup daemon. Under normal conditions this queue is nearly empty
/var/spool/postfix/active	Active queue. Contains messages ready to be sent. The queue manager places messages here from the incoming queue as soon as they are available
/var/spool/postfix/deferred	Deferred queue. A message is placed here when all its deliverable recipients are delivered, and for some recipients delivery failed for a transient reason. The queue manager scans this queue periodically and puts some messages into the active queue for a retry
/var/spool/postfix/bounce	Message delivery status report about why mail is bounced (non-delivered mail)
/var/spool/postfix/defer	Message delivery status report about why mail is delayed (non-delivered mail)
/var/spool/postfix/trace	Message delivery status report (delivered mail)

postfix reload	Reload configuration
<pre>postconf -e 'mydomain = example.org' postconf -l postconf -m postconf -v</pre>	Edit a setting in the Postfix configuration List supported mailbox lock methods List supported database types Increase logfile verbosity
<pre>postmap dbtype:textfile postmap hash:/etc/postfix/transport</pre>	Manage Postfix lookup tables, creating a hashed map file of database type <i>dbtype</i> from <i>textfile</i> Regenerate the transport database
postalias newaliases	Convert /etc/aliases into the aliases database file /etc/aliases.db

/etc/postfix/main.cf	Postfix configuration file
mydomain = example.org	This system's domain
myorigin = \$mydomain	Domain from which all sent mail will appear to originate
myhostname = foobar.\$mydomain	This system's hostname
<pre>inet_interfaces = all</pre>	Network interface addresses that this system receives mail on. Value can also be localhost, all, or loopback-only
<pre>proxy_interfaces = 1.2.3.4</pre>	Network interface addresses that this system receives mail on by means of a proxy or NAT unit
mynetworks = 10.3.3.0/24 !10.3.3.66	Networks the SMTP clients are allowed to connect from
<pre>mydestination = \$myhostname localhost \$mydomain example.com hash:/etc/postfix/otherdomains</pre>	Domains for which Postfix will accept received mail. Value can also be a lookup database file e.g. a hashed map
relayhost = 10.6.6.6	Relay host to which Postfix should send all mail for delivery, instead of consulting DNS MX records
<pre>relay_domains = \$mydestination</pre>	Sources and destinations for which mail will be relayed. Can be empty if Postfix is not intended to be a mail relay
<pre>virtual_alias_domains = virtualex.org virtual_alias_maps = /etc/postfix/virtual or virtual_alias_domains = hash:/etc/postfix/virtual</pre>	Set up Postfix to handle mail for virtual domains too. The /etc/postfix/virtual file is a hashed map, each line of the file containing the virtual domain email address and the destination real domain email address: jdoe@virtualex.org john.doe@example.org ksmith@virtualex.org kim.smith @virtualex.org reat
	@virtualex.orgrootThe last line is a catch-all specifying that all other emailmessages to the virtual domain are delivered to the root useron the real domain
<pre>mailbox_command = /usr/bin/procmail</pre>	Use Procmail as MDA

A line beginning with whitespace or tab is a continuation of the previous line. A line beginning with a # is a comment. The # is not a comment delimiter if it is not placed at the beginning of a line.

private	Whether	the service	e is acce	ssible or	ily by Po	stfix daen	nons and not by the whole system. Default is yes
unprivileged	unprivileged Whether the service is unprivileged i.e. not running as root. Default is yes			s root. Default is yes			
chroot Whether the service is chrooted. Default is yes							
wakeup How often the service needs to be woken up by the master daemon. Default is never							
maxproc	maxproc Max number of simultaneous processes providing the service. Default is 50						
command	command Command used to start the service						
i ne – indicates that	The – indicates that an option is set to its default value.						

Procmail is a regex-based MDA whose main purpose is to preprocess and sort incoming email messages. It is able to work both with the standard mbox format and the Maildir format.

To have all email processed by Procmail, the ~/.forward file may be edited to contain: "|exec /usr/local/bin/procmail || exit 75"

/etc/procmailrc	System-wide recipes
~/.procmailrc	User's recipes
procmail -h	List all Procmail flags for recipes
formail	Utility for email filtering and editing
lockfile	Utility for mailbox file locking
mailstat	Utility for generation of reports from Procmail logs

/etc/procmailrc and ~	/.procmailrc Procmail recipes
PATH=\$HOME/bin:/usr/bin:/bin:/usr/sbin:/sbin MAILDIR=\$HOME/Mail DEFAULT=\$MAILDIR/Inbox LOGFILE=\$HOME/.procmaillog	Common parameters, non specific to Procmail
:0h: OF :0: * ^From: .*(alice bob)@foobar\.org \$DEFAULT	Flag: match headers (default) and use file locking (highly recommended when writing to a file or a mailbox in mbox format) Condition: match the header specifying the sender address Destination: default mailfolder
:0: * ^From: .*owner@listserv\.com * ^Subject:.*Linux \$MAILDIR/Geekstuff1	Conditions: match sender address and subject headers Destination: specified mailfolder, in mbox format
:0 * ^From: .*owner@listserv\.com * ^Subject:.*Linux \$MAILDIR/Geekstuff2/	Flag: file locking not necessary because using Maildir format Conditions: match sender address and subject headers Destination: specified mailfolder, in Maildir format
<pre># Blacklisted by SpamAssassin :0 * ^X-Spam-Status: Yes /dev/null</pre>	Flag: file locking not necessary because blackholing to /dev/null Condition: match SpamAssassin's specific header Destination: delete the message
:0B: * hacking \$MAILDIR/Geekstuff	Flag: match body of message instead of headers
:0HB: * hacking \$MAILDIR/Geekstuff	Flag: match either headers or body of message
:0: * > 256000 /root/myprogram	Condition: match messages larger than 256 Kb Destination: pipe message through the specified program
:Ofw * ^From: .*@foobar\.org /root/myprogram	Flags: use the pipe as a filter (modifying the message), and tell Procmail to wait that the filter finished processing the message
:0c * ^Subject:.*administration ! secretary@domain.com :0: \$MAILDIR/Forwarded	Flag: copy the message and proceed with next recipe Destination: forward to specified email address, and (as ordered by the next recipe) save in the specified mailfolder

Courier POP configuration

The Courier MTA provides modules for ESMTP, IMAP, POP3, webmail, and mailing list services in a single framework.

The courier-authlib service must be launched first, then the desired mail service e.g. courier-imap for the IMAP service.

	imapd	Courier IMAP daemon configuration
/usr/lib/courier-imap/etc/ or	imapd-ssl	Courier IMAPS daemon configuration
/etc/courier/	pop3d	Courier POP3 daemon configuration
	pop3d-ssl	Courier POP3S daemon configuration
/usr/lib/courier-imap/share,	/	Directory for public and private keys
mkimapdcert		Generate a certificate for the IMAPS service
mkpop3dcert		Generate a certificate for the POP3 service
makealiases		Create system aliases in /usr/lib/courier/etc/aliases.dat, which is made by processing a /usr/lib/courier/etc/aliases/system text file: root : postmaster mailer-daemon : postmaster MAILER-DAEMON : postmaster uucp : postmaster postmaster : admin

/usr/lib/courier-imap/etc/pop3d Courier POP configuration file		
ADDRESS=0	Address to listen on. 0 means all addresses	
PORT=127.0.0.1.900,192.168.0.1.900	Port number connections are accepted on. Accept connections on port 900 on IP addresses 127.0.0.1 and 192.168.0.1	
POP3AUTH="LOGIN CRAM-MD5 CRAM-SHA1"	POP authentication advertising SASL (Simple Authentication and Security Layer) capability, with CRAM-MD5 and CRAM-SHA1	
POP3AUTH_TLS="LOGIN PLAIN"	Also advertise SASL PLAIN if SSL is enabled	
MAXDAEMONS=40	Maximum number of POP3 servers started	
MAXPERIP=4	Maximum number of connections to accept from the same IP address	
PIDFILE=/var/run/courier/pop3d.pid	PID file	
TCPDOPTS="-nodnslookup -noidentlookup"	Miscellaneous couriertcpd options that shouldn't be changed	
LOGGEROPTS="-name=pop3d"	courierlogger options	
POP3_PROXY=0	Enable or disable proxying	
PROXY_HOSTNAME=myproxy	Override value from gethostname() when checking if a proxy connection is required	
DEFDOMAIN="@example.com"	Optional default domain. If the username does not contain the first character of DEFDOMAIN, then it is appended to the username. If DEFDOMAIN and DOMAINSEP are both set, then DEFDOMAIN is appended only if the username does not contain any character from DOMAINSEP	
POP3DSTART=YES	Flag intended to be read by the system startup script	
MAILDIRPATH=Maildir	Name of the maildir directory	

/usr/lib/courier-imap/et	tc/imapd Courier IMAP configuration file
ADDRESS=0	Address to listen on. 0 means all addresses
PORT=127.0.0.1.900,192.168.0.1.900	Port number connections are accepted on. Accept connections on port 900 on IP addresses 127.0.0.1 and 192.168.0.1
AUTHSERVICE143=imap	Authenticate using a different service parameter depending on the connection's port. This only works with authentication modules that use the service parameter, such as PAM
MAXDAEMONS=40	Maximum number of IMAP servers started
MAXPERIP=20	Maximum number of connections to accept from the same IP address
PIDFILE=/var/run/courier/imapd.pid	File where couriertcpd will save its process ID
TCPDOPTS="-nodnslookup -noidentlookup"	Miscellaneous couriertcpd options that shouldn't be changed
LOGGEROPTS="-name=imapd"	courierlogger options
DEFDOMAIN="@example.com"	Optional default domain. If the username does not contain the first character of DEFDOMAIN, then it is appended to the username. If DEFDOMAIN and DOMAINSEP are both set, then DEFDOMAIN is appended only if the username does not contain any character from DOMAINSEP
IMAP_CAPABILITY="IMAP4rev1 UIDPLUS \ CHILDREN NAMESPACE THREAD=ORDEREDSUBJECT \ THREAD=REFERENCES SORT QUOTA IDLE"	Specifies what most of the response should be to the CAPABILITY command
IMAP_KEYWORDS=1	 Enable or disable custom IMAP keywords. Possible values are: disable keywords enable keywords enable keywords with a slower algorithm
IMAP_ACL=1	Enable or disable IMAP ACL extension
SMAP_CAPABILITY=SMAP1	Enable the experimental Simple Mail Access Protocol extensions
IMAP_PROXY=0	Enable or disable proxying
IMAP_PROXY_FOREIGN=0	Proxying to non-Courier servers. Re-sends the CAPABILITY command after logging in to remote server. May not work with all IMAP clients
IMAP_IDLE_TIMEOUT=60	How often, in seconds, the server should poll for changes to the folder while in IDLE mode
IMAP_CHECK_ALL_FOLDERS=0	Enable or disable server check for mail in every folder
IMAP_UMASK=022	Set the umask of the server process. This value is passed to the umask command. This feature is mostly useful for shared folders, where the file permissions of the messages may be important
IMAP_ULIMITD=131072	Set the upper limit of the size of the data segment of the server process, in Kb. This value is passed to the ulimit -d command. This feature is used as an additional safety check that should stop any potential DoS attacks that exploit any kind of a memory leak to exhaust all the available memory on the server
IMAP_USELOCKS=1	Enable or disable dot-locking to support concurrent multiple access to the same folder. Strongly recommended when using shared folders
IMAP_SHAREDINDEXFILE=\ /etc/courier/shared/index	Index of all accessible folders. Normally, this setting should not be changed
IMAP_TRASHFOLDERNAME=Trash	Name of the trash folder
IMAP_EMPTYTRASH=Trash:7,Sent:30	Purge folders i.e. delete all messages from the specified folders after the specified number of days
IMAP_MOVE_EXPUNGE_TO_TRASH=0	Enable or disable moving expunged messages to the trash folder (instead of straight deleting them)
HEADERFROM=X-IMAP-Sender	Make the return address, \$SENDER, being saved in the X-IMAP-Sender mail header. This header gets added to the sent message (but not in the copy of the message saved in the folder)
MAILDIRPATH=Maildir	Name of the mail directory

Dovecot is an open source, security-hardened, fast and efficient IMAP and POP3 server. By default it uses PAM authentication. The script mkcert.sh can be used to create self-signed SSL certificates.

/etc/dovecot.conf Dovecot configuration file		
<pre>base_dir = /var/run/dovecot/</pre>	Base directory where to store runtime data	
protocols = imaps pop3s	Protocols to serve. If Dovecot should use dovecot-auth, this can be set to none	
listen = *, [::]	Network interfaces to accept connections on. Here, listen to all IPv4 and IPv6 interfaces	
disable_plaintext_auth = yes	Disable LOGIN command and all other plaintext authentications unless SSL/TLS is used (LOGINDISABLED capability)	
<pre>shutdown_clients = yes</pre>	Kill all IMAP and POP3 processes when Dovecot master process shuts down. If set to no, Dovecot can be upgraded without forcing existing client connections to close	
<pre>log_path = /dev/stderr</pre>	Log file to use for error messages, instead of sending them to syslog. Here, log to stderr	
<pre>info_log_path = /dev/stderr</pre>	Log file to use for informational and debug messages. Default value is the same as log_path	
syslog_facility = mail	Syslog facility to use if logging to syslog	
<pre>login_dir = /var/run/dovecot/login</pre>	Directory where the authentication process places authentication UNIX sockets, to which the login process needs to be able to connect	
<pre>login_chroot = yes</pre>	Chroot login process to the login_dir	
login_user = dovecot	User to use for the login process. This user is used to control access for authentication process, and not to access mail messages	
login_process_size = 64	Maximum login process size, in Mb	
<pre>login_process_per_connection = yes</pre>	If yes, each login is processed in its own process (more secure); if no, each login process processes multiple connections (faster)	
<pre>login_processes_count = 3</pre>	Number of login processes to keep for listening for new connections	
<pre>login_max_processes_count = 128</pre>	Maximum number of login processes to create	
<pre>login_max_connections = 256</pre>	Maximum number of connections allowed per each login process. This setting is used only if <pre>login_process_per_connection = no;</pre> once the limit is reached, the process notifies master so that it can create a new login process	
<pre>login_greeting = Dovecot ready.</pre>	Greeting message for clients	
login_trusted_networks = \ 10.7.7.0/24 10.8.8.0/24	Trusted network ranges (usually IMAP proxy servers). Connections from these IP addresses are allowed to override their IP addresses and ports, for logging and authentication checks. disable_plaintext_auth is also ignored for these networks	
<pre>mbox_read_locks = fcntl mbox_write_locks = dotlock fcntl</pre>	Locking methods to use for locking mailboxes in mbox format.Possible values are:dotlockCreate mailbox.lock file; oldest and NSF-safe methoddotlock_trySame as dotlock, but skip if failingfcntlRecommended; works with NFS too if lockd is usedflockMay not exist in all systems; doesn't work with NFSlockfMay not exist in all systems; doesn't work with NFS	
<pre>maildir_stat_dirs = no</pre>	Option for mailboxes in Maildir format. If no (default), the LIST command returns all entries in the mail directory beginning with a dot. If yes, returns only entries which are directories	
dbox_rotate_size = 2048 dbox_rotate_min_size = 16	Maximum and minimum file size, in Kb, of a mailbox in dbox format until it is rotated	
!include /etc/dovecot/conf.d/*.conf	Include configuration file	
!include try /etc/dovecot/extra.conf	Include optional configuration file, do not give error if file not found	

/etc/dovecot.	conf Dovecot configuration file
<pre>mail_location = \ mbox:~/mail:INBOX=/var/spool/mail/%u</pre>	Mailbox location, in mbox or Maildir format. Variables: %u username
<pre>or mail_location = maildir:~/Maildir</pre>	%nuser part in user@domain, same as %u if there is no domain%ddomain part in user@domain, empty if there is no domain%hhome directory
namespace shared {	Definition of a shared namespace, for accessing other users' mailboxes that have been shared. Private namespaces are for users' personal emails. Public namespaces are for shared mailboxes managed by root user
separator = /	Hierarchy separator to use. Should be the same for all namespaces; it depends on the underlying mail storage format
prefix = shared/%%u/	Prefix required to access this namespace; must be different for each. Here, mailboxes are visible under shared/user@domain/ ; the variables %%n, %%d and %%u are expanded to the destination user
location = maildir:%%h/Maildir:\ INDEX=~/Maildir/shared/%%u	Mailbox location for other users' mailboxes; it is in the same format as mail_location which is also the default for it. %variable and ~/ expand to the logged in user's data; %%variable expands to the destination user's data
inbox = no	There can be only one INBOX, and this setting defines which namespace has it
hidden = no	Define whether the namespace is hidden i.e. not advertised to clients via NAMESPACE extension
subscriptions = no	Namespace handles its own subscriptions; if set to no, the parent namespace handles them and Dovecot uses the default namespace for saving subscriptions. If prefix is empty, this should be set to yes
list = children	Show the mailboxes under this namespace with LIST command, making the namespace visible for clients that do not support the NAMESPACE extension. Here, lists child mailboxes but hide the namespace prefix; list the namespace only if there are visible shared mailboxes
mail_uid = 666 mail_gid = 666	UID and GID used to access mail messages
mail_privileged_group = mail	Group to enable temporarily for privileged operations; currently this is used only with INBOX when its initial creation or a dotlocking fails
<pre>mail_access_groups = tmpmail</pre>	Supplementary groups to grant access to for mail processes; typically these are used to set up access to shared mailboxes
lock_method = fcntl	Locking method for index files. Can be fcntl, flock, or dotlock
<pre>first_valid_uid = 500 last_valid_uid = 0</pre>	Valid UID range for users; default is 500 and above. This makes sure that users cannot login as daemons or other system users. Denying root login is hardcoded to Dovecot and cannot be bypassed
<pre>first_valid_gid = 1 last_valid_gid = 0</pre>	Valid GID range for users; default is non-root/wheel. Users having non-valid primary GID are not allowed to login
<pre>max_mail_processes = 512</pre>	Maximum number of running mail processes. When this limit is reached, new users are not allowed to login
mail_process_size = 256	Maximum mail process size, in Mb
valid_chroot_dirs =	List of directories under which chrooting is allowed for mail processes
<pre>mail_chroot =</pre>	Default chroot directory for mail processes. Usually not needed as Dovecot does not allow users to access files outside their mail directory
<pre>mailbox_idle_check_interval = 30</pre>	When IDLE command is running, mailbox is checked once in a while to see if there are any new mails or other changes. This setting defines the minimum time to wait between these checks, in seconds

Dovecot POP and IMAP

/etc/dovecot.conf Dovec	ot configuration file
protocol pop3 {	Block with options for the POP3 protocol
listen = *:110	Network interfaces to accept POP3 connections on
<pre>login_executable = /usr/libexec/dovecot/pop3-login</pre>	Location of the POP3 login executable
<pre>mail_executable = /usr/libexec/dovecot/pop3</pre>	Location of the POP3 mail executable
<pre>pop3_no_flag_updates = no</pre>	If set to no, do not try to set mail messages non-recent or seen with POP3 sessions, to reduce disk I/O. With Maildir format do not move files from <code>new/</code> to <code>cur/</code> , with mbox format do not write <code>Status-</code> headers
<pre>pop3_lock_session = no</pre>	Whether to keep the mailbox locked for the whole POP3 session
<pre>pop3_uidl_format = %08Xu%08Xv</pre>	POP3 UIDL (Unique Mail Identifier) format to use
<pre>protocol imap {</pre>	Block with options for the IMAP protocol
listen = *:143 ssl_listen = *:993	Network interfaces to accept IMAP and IMAPS connections on
<pre>login_executable = /usr/libexec/dovecot/imap-login</pre>	Location of the IMAP login executable
<pre>mail_executable = /usr/libexec/dovecot/imap</pre>	Location of the IMAP mail executable
<pre>mail_max_userip_connections = 10</pre>	Maximum number of IMAP connections allowed for a user from each IP address
<pre>imap_idle_notify_interval = 120</pre>	How many seconds to wait between "OK Still here" notifications when client is IDLE
}	
ssl = yes	SSL/TLS support. Possible values are yes, no, required
<pre>ssl_cert_file = /etc/ssl/certs/dovecot-cert.pem</pre>	Location of the SSL certificate
<pre>ssl_key_file = /etc/ssl/private/dovecot-key.pem</pre>	Location of private key
ssl_key_password = b1gs3cr3t	Password of private key, if it is password-protected. Since /etc/dovecot.conf is usually world-readable, it is better to place this setting into a root-owned 0600 file instead and include it via the setting !include_try /etc/dovecot/dovecot-passwd.conf . Alternatively, Dovecot can be started with dovecot -p blgs3cr3t
<pre>ssl_ca_file = /etc/dovecot/cafile.pem</pre>	List of trusted SSL certificate authorities; the file contains the CA certificates followed by the CRLs
<pre>ssl_verify_client_cert = yes</pre>	Request client to send a certificate
<pre>ssl_verify_client_cert = yes ssl_cipher_list = ALL:!LOW:!SSLv2</pre>	Request client to send a certificate List of SSL ciphers to use

/etc/dovecot.conf D	ovecot configuration file
<pre>auth_executable = /usr/libexec/dovecot/dovecot-auth</pre>	Location of the authentication executable
auth_process_size = 256	Max authentication process size, in Mb
auth_username_chars = abcde VWXYZ012345678900	List of allowed characters in the username. If the username entered by user contains a character not listed in here, the login automatically fails. This is to prevent an user exploiting any potential quote escaping vulnerabilities with SQL/LDAP databases
<pre>auth_realms =</pre>	List of realms for SASL authentication mechanisms that need them. If empty, multiple realms are not supported
<pre>auth_default_realm = example.org</pre>	Default realm/domain to use if none was specified
<pre>auth_anonymous_username = anonymous</pre>	Username to assign to users logging in with ANONYMOUS SASL mechanism
auth_verbose = no	Whether to log unsuccessful authentication attempts and the reasons why they failed
auth_debug = no	Whether to enable more verbose logging (e.g. SQL queries) for debugging purposes
auth_failure_delay = 2	Delay before replying to failed authentications, in seconds
auth default {	
mechanisms = plain login cram-md5	Accepted authentication mechanisms
<pre>passdb passwd-file { args = /etc/dovecot.deny deny = yes }</pre>	Deny login to the users listed in /etc/dovecot.deny (file contains one user per line)
passdb pam { args = cache_key=%u%r dovecot }	PAM authentication block. Enable authentication matching (username and remote IP address) for PAM.
<pre>passdb passwd { blocking = yes args = }</pre>	System users e.g. NSS or /etc/passwd
<pre>passdb shadow { blocking = yes args = }</pre>	Shadow passwords for system users e.g. NSS or /etc/passwd
<pre>passdb bsdauth { cache_key = %u args = }</pre>	PAM-like authentication for OpenBSD
<pre>passdb sql { args = /etc/dovecot/dovecot-sql.conf }</pre>	SQL database
<pre>passdb ldap { args = /etc/dovecot/dovecot-ldap.conf }</pre>	LDAP database
<pre>socket listen { master { path = /var/run/dovecot/auth-master mode = 0600 user = group = } client { path = /var/run/dovecot/auth-client mode = 0660 } }</pre>	Export the authentication interface to other programs. Master socket provides access to userdb information; it is typically used to give Dovecot's local delivery agent access to userdb so it can find mailbox locations. The default user/group is the one who started dovecot-auth (i.e. root). The client socket is generally safe to export to everyone. Typical use is to export it to the SMTP server so it can do SMTP AUTH lookups using it
}	

Active mode (default)

- 1. Client connects to FTP server on port 21 (control channel) and sends second unprivileged port number
- 2. Server acknowledges
- 3. Server connects from port 20 (data channel) to client's second unprivileged port number
- 4. Client acknowledges

Passive mode (more protocol-compliant, because it is the client that initiates the connection) 1. Client connects to FTP server on port 21 and requests passive mode via the PASV command

- 2. Server acknowledges and sends unprivileged port number via the PORT command
- 3. Client connects to server's unprivileged port number
- 4. Server acknowledges

Very Secure FTP is a hardened and high-performance FTP implementation. The vsftpd daemon operates with multiple processes that run as a non-privileged user in a chrooted jail.

/etc/vsftpd.conf		
listen=NO	Run vsftpd in standalone mode (i.e. not via inetd)?	
local_enable=YES	Allow local system users (i.e. in /etc/passwd) to log in?	
chroot_local_user=YES	Chroot local users in their home directory?	
write_enable=YES	Allow FTP commands that write on the filesystem (i.e. STOR, DELE, RNFR, RNTO, MKD, RMD, APPE and SITE)?	
anonymous_enable=YES	Allow anonymous logins? If yes, anonymous and ftp are accepted as logins	
anon_root=/var/ftp/pub	After anonymous login, go to directory /var/ftp/pub	
anon_upload_enable=YES	Allow anonymous uploads?	
chown_uploads=YES	Change ownership of anonymously uploaded files?	
chown_username=ftp	Change ownership of anonymously uploaded files to user ${\tt ftp}$	
anon_world_readable_only=NO	Allow anonymous users to only download files which are world readable?	
ssl_enable=YES	Enable SSL?	
force_local_data_ssl=N0	Encrypt local data?	
<pre>force_local_logins_ssl=YES</pre>	Force encrypted authentication?	
allow_anon_ssl=YES	Allow anonymous users to use SSL?	
<pre>ssl_tlsv1=YES ssl_tlsv2=NO ssl_tlsv3=NO</pre>	Versions of SSL/TLS to allow	
<pre>rsa_cert_file=/etc/pki/tls/certs/vsftpd.pem</pre>	Location of certificate file	
<pre>rsa_private_key_file=/etc/pki/tls/certs/vsftpd.pem</pre>	Location of private key file	

Pure-FTP is a free, easy-to-use FTP server.

pure-ftpd	Pure-FTP daemon
pure-ftpwho	Show clients connected to the Pure-FTP server
pure-mrtginfo	Show connections to the Pure-FTP server as a MRTG graph
pure-statsdecode	Show Pure-FTP log data
pure-pw	Manage Pure-FTP virtual accounts
pure-pwconvert	Convert the system user database to a Pure-FTP virtual accounts database
pure-quotacheck	Manage Pure-FTP quota database
pure-uploadscript	Run a command on the Pure-FTP server to process an uploaded file

cupsd	CUPS (Common Unix Printing System) daemon. Administration of printers is done via web interface on http://localhost:631
/etc/cups/cupsd.conf	CUPS configuration file
/etc/cups/printers.conf	Database of available local CUPS printers
/etc/printcap	Database of printer capabilities, for old printing applications
/var/spool/cups/	Printer spooler for data awaiting to be printed
/var/log/cups/error_log	CUPS error log
/var/log/cups/page_log	Information about printed pages
/etc/init.d/cupsys start	Start the CUPS service
gnome-cups-manager	Run the CUPS Manager graphical application
cupsenable printer0	Enable a CUPS printer
cupsdisable printer0	Disable a CUPS printer
cupsaccept printer0	Accept a job sent on a printer queue
cupsreject -r "Rejected" printer0	Reject a job sent on a printer queue, with an informational message
cupstestppd LEXC510.ppd	Test the conformance of a PPD file to the format specification
cupsaddsmb printer0	Export a printer to SAMBA (for use with Windows clients)
cups-configcflags	Show the necessary compiler options
cups-configdatadir	Show the default CUPS data directory
cups-configldflags	Show the necessary linker options
cups-configlibs	Show the necessary libraries to link to
cups-configserverbin	Show the default CUPS binaries directory that stores filters and backends
cups-configserverroot	Show the default CUPS configuration file directory
lpstat	Show CUPS status information
lpadmin	Administer CUPS printers
lpadmin -p printer0 -P LEXC750.ppd	Specify a PPD (Adobe PostScript Printer Description) file to associate to a printer
lp -d printer0 file	Print a file on the specified printer
lpq	View the default print queue
lpq -P printer0	View a specific print queue
lpq jdoe	View the print queue of a specific user
lprm -P printer0 5	Delete a specific job from a printer queue
lprm -P printer0 jdoe	Delete all jobs from a specific user from a printer queue
lprm -P printer0 -	Delete all jobs from a printer queue
lpc	Manage print queues
a2ps file.txt	Convert a text file to PostScript
ps2pdf file.ps	Convert a file from PostScript to PDF
mpage file.ps	Print a PostScript document on multiple pages per sheet on a PostScript printer
gv file.ps	View a PostScript document (the gv software is derived from GhostView)

IP addressing

	IPv4	IPv6	
193.22.33.44	32-bit divided in 4 octets (dotted-quad)	2130:0000:0000:0007:0040:15bc:235f 2130:0:0:0:7:40:15bc:235f	128-bit divided in 8 16-bit sections
	4 billion addresses	2130::7:40:15bc:235f	3×10^{38} addresses

		IPv4 classful addressing	(assigned by IAN	A)	
		Address range	Prefix	Number of addresses	Reference
	Class A (Unicast)	0.0.0.0 - 127.255.255.255 first octet: 0XXX XXXX	/8	128 networks × 16,777,216 addresses	RFC 791
	Class B (Unicast)	128.0.0.0 - 191.255.255.255 first octet: 10XX XXXX	/16	16,384 networks × 65,536 addresses	RFC 791
Classful	Class C (Unicast)	192.0.0.0 - 223.255.255.255 first octet: 110X XXXX	/24	2,097,152 networks × 256 addresses	RFC 791
	Class D (Multicast)	224.0.0.0 - 239.255.255.255 first octet: 1110 XXXX	/4	268,435,456	RFC 3171
	Class E (Experimental)	240.0.0.0 - 255.255.255.255 first octet: 1111 XXXX	/4	268,435,456	RFC 1166
	Private Class A	10.0.0.0 - 10.255.255.255	10.0.0/8	16,777,216	RFC 1918
Private	Private Class B	172.16.0.0 - 172.31.255.255	172.16.0.0/12	1,048,576	RFC 1918
	Private Class C	192.168.0.0 - 192.168.255.255	192.168.0.0/16	65,536	RFC 1918
	Source	0.0.0.0 - 0.255.255.255	0.0.0/8	16,777,216	RFC 1700

Each block of a column identifies a subnet, whose range of valid hosts addresses is [network address +1 - broadcast address -1] inclusive. The network address of the subnet is the number shown inside a block. The broadcast address of the subnet is the network address of the block underneath -1 or, for the bottom block, .255.

Most common well-known ports				
Port	number	Service		
20	ТСР	FTP (data)		
21	ТСР	FTP (control)		
22	ТСР	SSH		
23	ТСР	Telnet		
25	ТСР	SMTP		
53	TCP/UDP	DNS		
67	UDP	BOOTP/DHCP (server)		
68	UDP	BOOTP/DHCP (client)

The full list of well-known ports is in /etc/services				

Network configuration commands

ip addr show ifconfig -a		Display configuration of all network interfaces
ip link show eth0 ifconfig eth0		Display configuration of eth0
ip addr add dev eth0 10.1.1.1/8 ifconfig eth0 10.1.1.1 netmask		Configure IP address of eth0
ifconfig eth0 hw ether 45:67:89	eab:cd:ef	Configure MAC address of eth0
ip link set eth0 up ifconfig eth0 up ifup eth0		Activate eth0
ip link set eth0 down ifconfig eth0 down ifdown eth0		Shut down eth0
dhclient eth0 pump		Request an IP address via DHCP
dhcpcd eth0 (SUSE)		
ip neigh arp -a		Show the ARP cache table
ip neigh show 10.1.0.6 arp 10.1.0.6		Show the ARP cache entry for a host
ip neigh add 10.1.0.7 lladdr 01 arp -s 10.1.0.7 01:23:45:67:89:		Add a new ARP entry for a host
ip neigh del 10.1.0.7 dev eth0 arp -d 10.1.0.7		Delete a ARP entry
ip neigh flush all		Delete the ARP table for all interfaces
iwlist wlan0 scan	-	with their quality of signal and other information
iwlist wlan0 freq	Display transmission frequency s	-
iwlist wlan0 rate	Display transmission speed settir	-
iwlist wlan0 txpower	Display transmission power setti	ngs
iwlist wlan0 key	Display encryption settings	
iwgetid wlan0 option	Print NWID, ESSID, AP/Cell addr that is currently in use	ess or other information about the wireless network
iwconfig wlan0	Display configuration of wireless	interface wlan0
iwconfig wlan0 option	Configure wireless interface wlan	0
hostname		Get the hostname (stored in /etc/hostname)
hostname -f		Get the FQDN (Fully Qualified Domain Name)
hostname mylinuxbox		Set the hostname
hostnamectl set-hostnamestat	cic "mylinuxbox" (Red Hat)	
/etc/init.d/networking	Initialize network services	
/etc/init.d/network		

dig example.org	Perform a DNS lookup for the specified domain or hostname. Returns information in BIND zone file syntax; uses an internal resolver and hence does not honor /etc/resolv.conf
dig @10.7.7.7 -t MX example.org	Perform a DNS lookup for the MX record of the domain example.org, querying nameserver 10.7.7.7
dig -x 203.0.113.1	Perform a reverse DNS lookup for the IP address 203.0.113.1
host example.org	Perform a DNS lookup for the specified domain or hostname. Does honor /etc/resolv.conf
host example.org 10.7.7.7	Perform a DNS lookup for the domain example.org, querying nameserver 10.7.7.7
host 192.168.13.13	Perform a reverse DNS lookup for the IP address 192.168.13.13
nslookup example.org (deprecated)	Perform a DNS lookup for the specified domain or hostname
whois example.org	Query the WHOIS service for an Internet resource, usually a domain name
ping 10.0.0.2	Test if a remote host can be reached and measure the round-trip time to it (by sending an ICMP ECHO_REQUEST datagram and expecting an ICMP ECHO_RESPONSE)
fping -a 10.0.0.2 10.0.0.7 10.0.0.8	Ping multiple hosts in parallel and report which ones are alive
traceroute 10.0.0.3	Print the route, hop by hop, packets trace to a remote host (by sending a sequence of ICMP ECHO_REQUEST datagrams with increasing TTL values, starting with TTL=1)
tracepath 10.0.0.3	Simpler traceroute
mtr 10.0.0.3	traceroute and ping combined
telnet 10.0.0.4 23	Establish a telnet connection to the specified host and port (if port is omitted, use default port 23)
ftp 10.0.0.5	Establish an interactive FTP connection with host 10.0.0.5
<pre>wgetno-clobberhtml-extension \page-requisitesconvert-links \recursivedomains example.org \no-parent www.example.org/foobar</pre>	Download a whole website www.example.org/foobar
nc netcat (SUSE)	Netcat, the Swiss Army knife of networking, a very flexible generic TCP/IP client/server
nc -l -p 25	Listen for connections on port 25 (i.e. mimic a SMTP server). Send any input on stdin to the connected client and dump on stdout any data received from the client
nc 10.0.0.7 389 < myfile	Push the content of a file to port 389 on remote host 10.0.0.7
echo "GET / HTTP/1.0\r\n\r\n" nc 10.0.0.7 80	Connect to web server 10.0.0.7 and issue a HTTP GET command
while true; \ do nc -l -p 80 -q 1 < mypage.html; done	Start a web server, serving the specified HTML page to any connected client
nc -z 10.0.0.7 22	Scan for a listening SSH daemon on remote host 10.0.0.7
nc -v -n -z -w1 -r 10.0.0.7 1-1023	Run a TCP port scan against remote host 10.0.0.7. Probe randomly all privileged ports with a 1-second timeout, without resolving service names, and with verbose output
echo "" nc -v -n -w1 10.0.0.7 1-1023	Retrieve the greeting banner of any network service that might be running on remote host 10.0.0.7

netstat	Display network connections
netstattcp netstat -t	Display active TCP connections
netstat -l	Display only listening sockets
netstat -a	Display all listening and non-listening sockets
netstat -n	Display network connections, without resolving hostnames or portnames
netstat -p	Display network connections, with PID and name of program to which each socket belongs
netstat -i	Display network interfaces
netstat -s	Display protocol statistics
netstat -r	Display kernel routing tables (equivalent to route -e)
netstat -c	Display network connections continuously
SS	Display socket statistics (similar to netstat)
ss -t -a	Display all TCP sockets
nmap 10.0.0.1 nmap -sS 10.0.0.1	Scan for open ports (TCP SYN scan) on remote host 10.0.0.1
nmap -sP 10.0.0.1	Do a ping sweep (ICMP ECHO probes) on remote host
nmap -sU 10.0.0.1	Scan UDP ports on remote host
nmap -sV 10.0.0.1	Do a service and version scan on open ports
nmap -p 1-65535 10.0.0.1	Scan all ports (1-65535) on remote host, not only the common ports
nmap -0 10.0.0.1	Find which operating system is running on remote host (OS fingerprinting)
tcpdump -ni eth0	Sniff all network traffic on interface eth0, suppressing DNS resolution
tcpdump ip host 10.0.0.2 tcp port 25	Sniff network packets on TCP port 25 from and to 10.0.0.2
<pre>tcpdump ether host '45:67:89:ab:cd:ef'</pre>	Sniff traffic from and to the network interface with that MAC address
tcpdump 'src host 10.0.0.2 and \ (tcp port 80 or tcp port 443)'	Sniff HTTP and HTTPS traffic having as source host 10.0.0.2
tcpdump -ni eth0 not port 22	Sniff all traffic on eth0 except that belonging to the SSH connection
tcpdump -vvnn -i eth0 arp	Sniff ARP traffic on eth0, on maximum verbosity level, without converting host IP addresses and port numbers to names
tcpdump ip host 10.0.0.2 and \backslash not 10.0.0.9	Sniff IP traffic between 10.0.0.2 and any other host except 10.0.0.9
iptraf	IP LAN monitor (ncurses UI)

/sys/class/net	List of all network interfaces in the system
/etc/services	List of service TCP/UDP port numbers
/etc/protocols	List of available protocols
/etc/ethers	ARP mappings (MAC to IP addresses)
/etc/inetd.conf	Configuration file for inetd, the super-server Internet daemon

/etc/hosts	Mappings betweer	n IP addresses and hostnames, for name resolution
		lhost.localdomain localhost st.domain.org myhost
/etc/nsswitch.conf	Sources that must	t be used by various system library lookup functions
	passwd: files shadow: files group: files hosts: files	nisplus nis nisplus nis
/etc/host.conf		resolution, for systems before glibc2. eded by /etc/nsswitch.conf
	order hosts,bin multi on	ld
/etc/resolv.conf		omain names that must be appended to bare hostnames rs that will be used for name resolution
	search domain1. nameserver 192 nameserver 192	
/etc/networks	Mappings betweer	n network addresses and names
	loopback 127.0 mylan 10.2.	
/etc/network/interfaces	List and configura	tion of all network interfaces
/etc/hostname /etc/sysconfig/network (Red Hat)	Hostname of the l	local machine
/etc/sysconfig/network-scripts/ifcfg-et	h0 (Red Hat)	Configuration file for network interface eth0. This file is read by the ifup and ifdown scripts
		DEVICE=eth0 TYPE=Ethernet HWADDR=AA:BB:CC:DD:EE:FF BOOTPROTO=none ONBOOT=yes NM_CONTROLLED=no IPADDR=10.2.3.4
		NETMASK=255.255.255.0 GATEWAY=10.2.3.254 DNS1=8.8.8 DNS2=4.4.4.4 USERCTL=no
<pre>/etc/sysconfig/network-scripts/ifcfg-et /etc/sysconfig/network-scripts/ifcfg-et /etc/sysconfig/network-scripts/ifcfg-et</pre>	h0:1	Configuration files for different interface aliases. This makes possible to bind multiple IP addresses to single NIC
/etc/sysconfig/network-scripts/route-et	h0 (Red Hat)	Static route configuration for eth0
		ADDRESS=10.2.3.4 NETMASK=255.255.255.0 GATEWAY=10.2.3.254

/etc/hosts.allow
/etc/hosts.deny

Host access control files used by the TCP Wrapper system.

Each file contains zero or more *daemon:client* lines. The first matching line is considered.

Access is granted when a <code>daemon:client</code> pair matches an entry in <code>/etc/hosts.allow</code>. Otherwise, access is denied when a <code>daemon:client</code> pair matches an entry in <code>/etc/hosts.deny</code>. Otherwise, access is granted.

/etc/hosts.allow **and** /etc/hosts.deny **lines syntax**

ALL: ALL	All services to all hosts	
ALL: .example.edu	All services to all hosts of the example.edu domain	
ALL: .example.edu EXCEPT host1.example.edu	All services to all hosts of example.edu, except host1	
in.fingerd: .example.com	Finger service to all hosts of example.com	
in.tftpd: LOCAL	TFTP to hosts of the local domain only	
sshd: 10.0.0.3 10.0.0.4 10.1.1.0/24	SSH to the hosts and network specified	
sshd: 10.0.1.0/24	SSH to 10.0.1.0/24	
sshd: 10.0.1.	SSH to 10.0.1.0/24	
sshd: 10.0.1.0/255.255.255.0	SSH to 10.0.1.0/24	
<pre>in.tftpd: ALL: spawn (/safe_dir/safe_finger \ -l @%h /bin/mail -s %d-%h root) &</pre>	Send a finger probe to hosts attempting TFTP and notify root user via email	
portmap: ALL: (echo Illegal RPC request \ from %h /bin/mail root) &	When a client attempts a RPC request via the portmapper (NFS access), echo a message to the terminal and notify root user via email	

	route -en

Display IP routing table

Display kernel routing cache

ip route route -en route -F netstat -rn

ip route show cache
route -C

ip route add default via 10.1.1.254 route add default gw 10.1.1.254	Add a default gateway
ip route add 10.2.0.1 dev eth0 ip route add 10.2.0.1 via 10.2.0.254 route add -host 10.2.0.1 gw 10.2.0.254	Add a route for a host
ip route add 10.2.0.0/16 via 10.2.0.254 route add -net 10.2.0.0 netmask 255.255.0.0 gw 10.2.0.254	Add a route for a network
ip route delete 10.2.0.1 dev eth0 route del -host 10.2.0.1 gw 10.2.0.254	Delete a route for a host
ip route flush all	Delete the routing table for all interfaces

The Netfilter framework provides firewalling capabilities in Linux. It is implemented by the user-space application programs iptables for IPv4 (which replaced ipchains, which itself replaced ipfwadm) and ip6tables for IPv6. In Red Hat the iptables service is provided by the firewalld daemon.

Tables contain sets of chains, which contain sets of rules.

The filter table contains chains INPUT, FORWARD, OUTPUT (built-in chains).

The NAT table contains chains PREROUTING, OUTPUT, POSTROUTING.

The mangle table contains chains PREROUTING, OUTPUT.

When a packet enters the system, it is handed to the INPUT chain. If the destination is local, it is processed; if the destination is not local and IP forwarding is enabled, the packet is handed to the FORWARD chain, otherwise it is dropped. An outgoing packet generated by the system will go through the OUTPUT chain.

If NAT is in use, an incoming packet will pass at first through the PREROUTING chain, and an outgoing packet will pass last through the POSTROUTING chain.

iptables -A INPUT -s 10.0.0.6 -j ACCEPT Add a rule to accept all packets from 10.0.0.6 iptables -A INPUT -s 10.0.0.7 -j REJECT Add a rule to reject all packets from 10.0.0.7 and send back a ICMP response to the sender iptables -A INPUT -s 10.0.0.8 -j DROP Add a rule to silently drop all packets from 10.0.0.8 iptables -A INPUT -s 10.0.0.9 -j LOG Add a rule to log via Syslog all packets from 10.0.0.9, and take no further action iptables -D INPUT -s 10.0.0.9 -j LOG Delete a rule iptables -D INPUT 42 Delete rule 42 of the INPUT chain iptables -F INPUT Flush all rules of the INPUT chain iptables -t mangle -F Flush all rules of the mangle table iptables -t mangle -X Delete all user-defined (not built-in) rules in the mangle table iptables -L INPUT List the rules of the INPUT chain iptables -P INPUT -j DROP Define the chain policy, which takes effect when no rule matches and the end of the rules list is reached iptables -A OUTPUT -d 10.7.7.0/24 -j DROP Add a rule to drop all packets with destination 10.7.7.0/24 iptables -A FORWARD -i eth0 -o eth1 -j LOG Add a rule to log all packets entering the system via eth0 and exiting via eth1 iptables -A INPUT -p 17 -j DROP Add a rule to drop all incoming UDP traffic (protocol iptables -A INPUT -p udp -j DROP numbers are defined in /etc/protocols) iptables -A INPUT --sport 1024:65535 --dport 53 \ Add a rule to accept all packets coming from any -j ACCEPT unprivileged port and with destination port 53 iptables -A INPUT -p icmp --icmp-type echo-request \ Add a rule to accept incoming pings through eth0 at a -m limit --limit 1/s -i eth0 -j ACCEPT maximum rate of 1 ping/second iptables -A INPUT -m state --state ESTABLISHED \ Load the module for stateful packet filtering, and add a -j ACCEPT rule to accept all packets that are part of a communication already tracked by the state module iptables -A INPUT -m state --state NEW -j ACCEPT Add a rule to accept all packets that are not part of a communication already tracked by the state module iptables -A INPUT -m state --state RELATED -j ACCEPT Add a rule to accept all packets that are related (e.g. ICMP responses to TCP or UDP traffic) to a communication already tracked by the state module iptables -A INPUT -m state --state INVALID -j ACCEPT Add a rule to accept all packets that do not match any of the states above

87/1	L26
------	-----

NAT routing

SNAT (Source Network Address Translation)

iptables -t nat -A POSTROUTING -s 10.0.0.0/24 -o eth1 $\$ -j SNAT --to-source 93.184.216.119

- iptables -t nat -A POSTROUTING -s 10.0.0.0/24 -o eth1 \
 -j SNAT --to-source 93.184.216.119:93.184.216.127
- iptables -t nat -A POSTROUTING -o eth1 -j MASQUERADE

Map all traffic leaving the LAN to the external IP address 93.184.216.119

Map all traffic leaving the LAN to a pool of external IP addresses 93.184.216.119-127

Map all traffic leaving the LAN to the address dynamically assigned to eth1 via DHCP

DNAT (Destination Network Address Translation)

iptables -t nat -A PREROUTING -i eth1 -d 93.184.216.119 \setminus	Allow the internal host 10.0.0.13 to be publicly
-j DNATto-destination 10.0.0.13	reachable via the external address 93.184.216.119

PAT (Port Address Translation)

iptables -t nat -A PREROUTING -i eth1 -d 93.184.216.119 \ -p tcpdport 80 -j DNATto-destination 10.0.0.13:8080	Make publicly accessible a webserver that is located in the LAN, by mapping port 8080 of the internal host 10.0.0.13 to port 80 of the external address 93.184.216.119
iptables -t nat -A PREROUTING -i eth0 -d ! 10.0.0.0/24 \ -p tcpdport 80 -j REDIRECTto-ports 3128	Redirect all outbound HTTP traffic originating from the LAN to a proxy running on port 3128 on the Linux box

iptables-save > fwrules.saved Save iptables configuration to a file iptables-restore < fwrules.saved Restore a iptables configuration from a file sysctl -w net.ipv4.ip_forward=1 echo 1 > /proc/sys/net/ipv4/ip_forward

/etc/sysconfig/iptables

iptables rules

ssh root@remotehost	Connect to a remote host via SSH (Secure Shell) and login as the superuser
ssh -v root@remotehost ssh -vv root@remotehost ssh -vvv root@remotehost	Connect via SSH, with increasing levels of verbosity
ssh -p 2222 root@remotehost	Login as the superuser to a remote host via SSH using port 2222 instead of standard port 22
<pre>ssh root@remotehost /root/mycommand</pre>	Execute a command on a remote host
sftp root@remotehost	FTP-like tool for secure file transfer
<pre>scp myfile root@remotehost:/tmp/myfile2 scp root@remotehost:/tmp/myfile2 myfile scp jdoe@host1:/tmp/myfile root@host2:/root/myfile2</pre>	Non-interactive secure file copy. Can transfer files from local to remote, from remote to local, or between two remote hosts
sshpass -p p455w0rd ssh root@remotehost	Connect to a remote host using the specified password
pssh -i -H "host1 host2 host3" /root/mycommand	Execute a command in parallel on a group of remote hosts
ssh-keygen -t rsa -b 2048	Generate interactively a 2048-bit RSA key pair, prompting for a passphrase
ssh-keygen -t rsa -b 2048 ssh-keygen -t dsa	
	for a passphrase
ssh-keygen -t dsa	for a passphrase Generate a DSA key pair
ssh-keygen -t dsa ssh-keygen -p -t rsa	for a passphrase Generate a DSA key pair Change passphrase of the private key Generate a RSA key with no passphrase (for non-
ssh-keygen -t dsa ssh-keygen -p -t rsa ssh-keygen -q -t rsa -f /etc/ssh/id_rsa -N '' -C ''	for a passphrase Generate a DSA key pair Change passphrase of the private key Generate a RSA key with no passphrase (for non- interactive use) and no comment
ssh-keygen -t dsa ssh-keygen -p -t rsa ssh-keygen -q -t rsa -f /etc/ssh/id_rsa -N '' -C '' ssh-keygen -lf /etc/ssh/id_rsa.pub	for a passphrase Generate a DSA key pair Change passphrase of the private key Generate a RSA key with no passphrase (for non- interactive use) and no comment View key length and fingerprint of a public key Start the SSH Agent daemon that caches decrypted private keys in memory; also echoes to the terminal the environment variables that must be set. The cached keys
<pre>ssh-keygen -t dsa ssh-keygen -p -t rsa ssh-keygen -q -t rsa -f /etc/ssh/id_rsa -N '' -C '' ssh-keygen -lf /etc/ssh/id_rsa.pub ssh-agent</pre>	for a passphrase Generate a DSA key pair Change passphrase of the private key Generate a RSA key with no passphrase (for non- interactive use) and no comment View key length and fingerprint of a public key Start the SSH Agent daemon that caches decrypted private keys in memory; also echoes to the terminal the environment variables that must be set. The cached keys are automatically used by SSH tools ssh, sftp, and scp Show the PID of ssh-agent and set appropriate

SSH port forwarding (aka SSH tunneling)

ssh -L 2525:mail.foo.com:25 user@mail.foo.com	Establish a SSH encrypted tunnel from localhost to remote host mail.foo.com, redirecting traffic from local port 2525 to port 25 of remote host mail.foo.com. Useful if the local firewall blocks outgoing port 25. In this case, port 2525 is used to go out; the application must be configured to connect to localhost on port 2525 (instead of mail.foo.com on port 25)
ssh -L 2525:mail.foo.com:25 user@login.foo.com	Establish a SSH encrypted tunnel from localhost to remote host login.foo.com. Remote host login.foo.com will then forward, unencrypted, all data received over the tunnel on port 2525 to remote host mail.foo.com on port 25

SSH reverse forwarding (aka SSH reverse tunneling)

ssh -R 2222:localhost:22 user@login.foo.com

Establish a SSH encrypted reverse tunnel from remote host login.foo.com back to localhost, redirecting traffic sent to port 2222 of remote host login.foo.com back towards local port 22. Useful if the local firewall blocks incoming connections so remote hosts cannot connect back to local machine. In this case, port 2222 of login.foo.com is opened for listening and connecting back to localhost on port 22; remote host login.foo.com is then able to connect to the local machine on port 2222 (redirected to local port 22)

SSH as a SOCKS proxy

ssh -D 33333 user@login.foo.com

The application supporting SOCKS must be configured to connect to localhost on port 33333. Data is tunneled from localhost to login.foo.com, then unencrypted to destination

X11 Forwarding

ssh -X user@login.foo.com

Enable the local display to execute locally a X application stored on a remote host login.foo.com

How to enable public key authentication

- 1. Set PubkeyAuthentication yes in /etc/ssh/sshd config of remote server
- 2. Append your public key ~/.ssh/id_rsa.pub to the file ~/.ssh/authorized_keys on the remote server; this can be done by hand or via the command ssh-copy-id

How to enable host-based authentication amongst a group of trusted hosts

- 1. Set HostbasedAuthentication yes in /etc/ssh/sshd config on all hosts
- 2. Create /etc/ssh/shosts.equiv on all hosts, and enter in this file all trusted hostnames
- 3. Connect via SSH manually from your machine on each host so that all hosts' public keys go into ~/.ssh/known_hosts
- 4. Copy ~/.ssh/known_hosts from your machine to /etc/ssh/ssh_known_hosts on all hosts

How to enable SSH Agent

- 1. Type eval `ssh-agent`
- 2. Type ${\tt ssh-add}$ to add the private key to cache, and enter the key's passphrase

How to enable X11 Forwarding

- 1. On remote host 10.2.2.2, set X11Forwarding yes in /etc/ssh/sshd config, and make sure that xauth is installed
- 2. On local host 10.1.1.1, type ssh -X 10.2.2.2, then run on remote host the graphical application e.g. xclock &

X11 Forwarding can also be enabled via telnet (insecure and obsolete)

- 1. On remote host 10.2.2.2, type export DISPLAY=10.1.1.1:0.0
- 2. On local host 10.1.1.1, type xhost +
- 3. On local host 10.1.1.1, type telnet 10.2.2.2, then run on remote host the graphical application e.g. xclock &

	SSH files
/etc/ssh/sshd_config	SSH server daemon configuration file
/etc/ssh/ssh_config	SSH client global configuration file
/etc/ssh/ssh_host_key	Host's private key (should be mode 0600)
/etc/ssh/ssh_host_key.pub	Host's public key
/etc/ssh/shosts.equiv	Names of trusted hosts for host-based authentication
/etc/ssh/ssh_known_hosts	Database of host public keys that were previously accepted as legitimate
~/.ssh/	User's SSH directory (must be mode 0700)
~/.ssh/config	SSH client user configuration file
~/.ssh/id_rsa ~/.ssh/id_dsa	User's RSA or DSA private key, as generated by ssh-keygen
~/.ssh/id_rsa.pub ~/.ssh/id_dsa.pub	User's RSA or DSA public key, as generated by ssh-keygen
~/.ssh/known_hosts	Host public keys that were previously accepted as legitimate by the user
<pre>~/.ssh/authorized_keys ~/.ssh/authorized_keys2 (obsolete)</pre>	Trusted public keys; the corresponding private keys allow the user to authenticate on this host

/etc/ssh/sshd_config		
PermitRootLogin yes	Control superuser login via SSH. Possible values are:yesSuperuser can loginnoSuperuser cannot loginwithout-passwordSuperuser cannot login with passwordforced-commands-onlySuperuser can only run commands in SSH command line	
AllowUsers jdoe ksmith DenyUsers jhacker	List of users that can/cannot login via SSH, or \star for everybody	
AllowGroups geeks DenyGroups *	List of groups whose members can/cannot login via SSH, or \star for all groups	
PasswordAuthentication yes	Permit authentication via login and password	
PubKeyAuthentication yes	Permit authentication via public key	
HostbasedAuthentication yes	Permit authentication based on trusted hosts	
Protocol 1,2	Specify protocols supported by SSH. Value can be 1 or 2 or both	
X11Forwarding yes	Allow X11 Forwarding	

GnuPG

gpg --gen-key
gpg --import alice.asc
gpg --list-keys
gpg --list-secret-keys
gpg --list-public-keys
gpg --export -o keyring_backup.gpg
gpg --export-secret-key -a "You" -o private.key
gpg --export-public-key -a "Alice" -o alice.pub
gpg --edit-key "Alice"
gpg -e -u "You" -r "Alice" file.txt

gpg -d file.txt.gpg

Generate a key pair Import Alice's public key into your keyring List the keys contained into your keyring List your private keys contained into your keyring List the public keys contained into your keyring Export your whole keyring to a file Export your private key (username You) to a file Export Alice's public key to a file Sign Alice's public key Encrypt a file (to Alice i.e. with Alice's public key), signing it with your private key

Decrypt a file (with your own public key)

md5sum sha1sum sha224sum sha256sum sha384sum sha512sum Print a digest of a file depending on the selected hashing algorithm

openvpngenkeysecret <i>keyfile</i>	Generate a shared secret keyfile for OpenVPN authentication. The keyfile must be copied on both server and client		
openvpn server.conf	Start the VPN on the server side.	The encrypted VPN tunnel uses UDP port 1194	
openvpn client.conf	Start the VPN on the client side		
/etc/openvpn/server.conf	Server-side configuration file:		
	dev tun ifconfig [server IP] [client keepalive 10 60 ping-timer-rem persist-tun persist-key secret keyfile	IP]	
/etc/openvpn/client.conf	Client-side configuration file: remote [server public IP] dev tun ifconfig [client IP] [server keepalive 10 60 ping-timer-rem persist-tun persist-key secret keyfile	IP]	

Key bindings

Кеу	Alternate key	Function
CTRL F	•	Move cursor forward one char
CTRL B	G	Move cursor backward one char
CTRL A	HOME	Move cursor to beginning of line
CTRLE	END	Move cursor to end of line
CTRL H	BACKSPACE	Delete char to the left of cursor
CTRL		Delete word to the left of cursor
CTRL		Delete all chars to the left of cursor
CTRL K		Delete all chars to the right of cursor
CTRL T		Swap current char with previous char
ESC		Swap current word with previous word
SHIFT PAGE UP		Scroll up the buffer
SHIFT PAGE DOWN		Scroll down the buffer
CTRL		Clear screen (same as clear)
CTRL P	0	Previous command in history
CTRL	0	Next command in history
CTRL R		Reverse history search
ТАВ		Autocomplete file and directory names
CTRL	RETURN	Line feed
CTRL M		Carriage return
CTRLS		Pause trasfer to terminal
CTRL Q		Resume transfer to terminal
CTRL Z		Send a SIGTSTP to put the current job in background
CTRL C		Send a SIGINT to stop the current process
CTRL D		Send a EOF to current process (same as logout)
CTRL ALT DEL		Send a SIGINT to reboot the machine (same as shutdown -r now), as specified in /etc/inittab and /etc/init/control-alt-delete
CTRL ALT F1 F6		Switch between text consoles
CTRL ALT F7 F11		Switch between X Window consoles
CTRL ALT +		Increase X Window screen resolution
CTRL ALT -		Decrease X Window screen resolution
CTRL TAB		Switch between X Window tasks
CTRL ALT -		Switch to next workspace
CTRL ALT -		Switch to previous workspace
CTRL ALT BACKSPACE		Reboot the X Window server

The Hardware Abstraction Layer (HAL) manages device files and provides plug-and-play facilities. The HAL daemon hald maintains a persistent database of devices.

udev dynamically generates the device nodes in $/{\tt dev}/{\tt for}$ devices present on the system. udev also provides persistent naming for storage devices in $/{\tt dev}/{\tt disk}$.

When a device is added, removed, or changes state, the kernel sends an uevent received by the udevd daemon which will pass the uevent through a set of rules stored in /etc/udev/rules.d/*.rules and /lib/udev/rules.d/*.rules.

udevadm monitor udevmonitor	Show all kernel uevents and udev messages
udevadm infoattribute-walkname=/dev/sda	Print all attributes of device $/{\tt dev}/{\tt sda}$ in udev rules key format
cat /sys/block/sda/size	Print the size attribute of disk sda in 512-byte blocks. This information is retrieved from sysfs
udevadm test /dev/sdb	Simulate a udev event run for the device and print debug output
gnome-device-manager	Browser for the HAL device manager

<pre>/etc/udev/rules.d/*.rules and /lib/udev/rules</pre>	.d/*.rules udev rules
KERNEL=="hda", NAME="mydisk"	Match a device which was named by the kernel as hda; name the device node as mydisk. The device node will be therefore /dev/mydisk
KERNEL=="hdb", DRIVER=="ide-disk", SYMLINK+="mydisk myhd"	Match a device with kernel name and driver as specified; name the device node with the default name and create two symbolic links /dev/mydisk and /dev/myhd pointing to /dev/hdb
KERNEL=="fd[0-9]*", NAME="floppy/%n", SYMLINK+="%k"	Match all floppy disk drives (i.e. fdn); place device node in /dev/floppy/n and create a symlink /dev/fdn to it
SUBSYSTEM=="block", ATTR{size}=="41943040", SYMLINK+="mydisk"	Match a block device with a size attribute of 41943040; create a symlink $/{\tt dev/mydisk}$
KERNEL=="fd[0-9]*", OWNER="jdoe"	Match all floppy disk drives; give ownership of the device file to user jdoe
KERNEL=="sda", PROGRAM="/bin/mydevicenamer %k", SYMLINK+="%c"	Match a device named by the kernel as sda; to name the device, use the defined program which takes on stdin the kernel name and output on stdout e.g. <i>name1</i> <i>name2</i> . Create symlinks /dev/name1 and /dev/name2 pointing to /dev/sda
KERNEL=="sda", ACTION=="add", RUN+="/bin/myprogram"	Match a device named by the kernel as sda; run the defined program when the device is connected
KERNEL=="sda", ACTION=="remove", RUN+="/bin/myprogram"	Match a device named by the kernel as sda; run the defined program when the device is disconnected
<pre>%n = kernel number (e.g. = 3 for fd3) %k = kernel name (e.g. = fd3 for fd3) %c = device name as output from program</pre>	

A kernel version number has the form *major.minor.patchlevel*.

Kernel images are usually gzip-compressed and can be of two types: zImage (max 520 Kb) and bzImage (no size limit). Kernel modules can be loaded dynamically into the kernel to provide additional functionalities on demand, instead of being included when the kernel is compiled; this reduces memory footprint.

kerneld (daemon) and kmod (kernel thread) facilitate the dynamic loading of kernel modules.

/lib/modules/X.Y.Z/*.ko	Kernel modules for kernel version X.Y.Z
/lib/modules/X.Y.Z/modules.dep	Modules dependencies. This file needs to be recreated (via the command $depmod -a$) after a reboot or a change in module dependencies
<pre>/etc/modules.conf /etc/conf.modules (deprecated)</pre>	Modules configuration file
/usr/src/linux/	Contains the kernel source code to be compiled

Kernel configuration file

/usr/src/linux/.config

freeramdisk	Free the memory used for the $\tt initrd$ image. This command must be run directly after unmounting /initrd
mkinitrd [initrd image] [kernel version]	Create a initrd image file (Red Hat)
mkinitramfs	Create a initrd image file according to the configuration file /etc/initramfs-tools/initramfs.conf (Debian)
dracut	Create initial ramdisk images for preloading modules
dbus-monitor	Monitor messages going through a D-Bus message bus
dbus-monitorsession	Monitor session messages (default)
dbus-monitorsystem	Monitor system messages

The runtime loader ld.so loads the required shared libraries of the program into RAM, searching in this order:

1. ว	LD_LIBRARY_PATH /etc/ld.so.cache		le specifying the list of dirs where libraries should be searched for first
2.		Cache file	
3.	/lib and /usr/lib	Default locations for	r shared libraries
/eto	c/ld.so.conf		Configuration file used to specify other shared library locations (other than the default ones <code>/lib</code> and <code>/usr/lib</code>)
ldco	onfig		Create a cache file /etc/ld.so.cache of all available dynamically linked libraries. To be run when the system complains about missing libraries
ldd	[program or lib]		Print library dependencies

lsdev	List information about the system's hardware		
lspci	List PCI devices		
lspci -d 8086:	List all Intel hardware present. PCI IDs are stored in /usr/share/misc/pci.ids (Debian) or /usr/share/hwdata/pci.ids (Red Hat)		
lsusb	List USB devices		
lsusb -d 8086:	List all Intel USB devices present. USB IDs are stored in /var/lib/usbutils/usb.ids		
lshw	List system hardware		
dmesg	Print the messages of the kernel ring buffer		
dmesg -n 1	Set the logging level to 1 (= only panic messages)		
journalctl	Query the systemd journal		
journalctl -xn	Query the systemd journal for recent events only, and adding explanation texts		
journalctl -f	Query the systemd journal in real time, scrolling as new entries are added		
uname -s	Print the kernel name		
uname -n	Print the network node hostname		
uname -r	Print the kernel release number X.Y.Z		
uname -v	Print the kernel version number		
uname -m	Print the machine hardware name		
uname -p	Print the processor type		
uname -i	Print the hardware platform		
uname -o	Print the operating system		
uname -a	Print all the above information, in that order		

	Ke	rnel compile	
Download	Download kernel source code linux-X.Y.Z.tar.bz2 from http://www.kernel.org to the base of the kernel source tree /usr/src/linux		
	make clean	Delete most generated files	
Clean	make mrproper	Delete all generated files and kernel configuration	
	make distclean	Delete temporary files, patch leftover files, and similar	
	make config	Terminal-based (options must be set in sequence)	
	make menuconfig	ncurses UI	
	make xconfig make gconfig	GUI	
	make oldconfig	Create a new config file, based on the options in the old config file and in the source code	
Configure	Components (e.g. device drivers) can be either: - not compiled - compiled into the kernel binary, for support of devices always used on the system or necessary for the system to boot - compiled as a kernel module, for optional devices		
	The configuration command creatinstructions for the compile	tes a /usr/src/linux/.config config file containing	
	make bzImage	Compile the kernel	
Build	make modules	Compile the kernel modules	
Dalla	make all	Compile kernel and kernel modules	
	<pre>make -j2 all will speed up com</pre>	pilation by allocating 2 simultaneous compile jobs	
Modules install	make modules_install	<pre>Install the previously built modules present in /lib/modules/X.Y.Z</pre>	
	make install	Install the kernel automatically	
Kernel install	To install the kernel by hand: Copy the new compiled kernel and other files into the boot partition cp /usr/src/linux/arch/boot/bzImage /boot/vmlinuz-X.Y.Z (kernel) cp /usr/src/linux/arch/boot/System.map-X.Y.Z /boot cp /usr/src/linux/arch/boot/config-X.Y.Z /boot (config options used for this compile) Create an entry in GRUB to boot on the new kernel		
	Optionally, the kernel can be pad	kaged for install on other machines	
De alas as	make rpm-pkg	Build source and binary RPM packages	
Package	make binrpm-pkg	Build binary RPM package	
	make deb-pkg	Builds binary DEB package	

Kernel patching			
Download	Download and decompress the patch to /usr/src		
	patch -p1 < file.patch	Apply the patch	
Patch	<pre>patch -Rp1 < file.patch</pre>	To remove a patch, you can either apply the patch again or use this command (reverse patch)	
Build	Build the patched kernel as explained previously		
Install	Install the patched kernel as explained previously		

Kernel modules allow the kernel to access functions (symbols) for kernel services e.g. hardware drivers, network stack, or filesystem abstraction.

lsmod	List the modules that are currently loaded into the kernel
insmod <i>module</i>	Insert a module into the kernel. If the module requires another module or if it does not detect compatible hardware, insertion will fail
rmmod <i>module</i>	Remove a module from the kernel. If the module is in use by another module, it is necessary to remove the latter first
modinfo <i>module</i>	Display the list of parameters accepted by the module
depmod -a	Probe all modules in the kernel modules directory and generate the file that lists their dependencies

It is recommended to use modprobe instead of insmod/rmmod, because it automatically handles prerequisites when inserting modules, is more specific about errors, and accepts just the module name instead of requiring the full pathname.

<pre>modprobe module option=value</pre>	Insert a module into the running kernel, with the specified parameters. Prerequisite modules will be inserted automatically
modprobe -a	Insert all modules
modprobe -t <i>directory</i>	Attempt to load all modules contained in the directory until a module succeeds. This action probes the hardware by successive module-insertion attempts for a single type of hardware, e.g. a network adapter
modprobe -r <i>module</i>	Remove a module
modprobe -c <i>module</i>	Display module configuration
modprobe -1	List loaded modules

Configuration of device drivers		
Device drivers support the kernel with instructions on how to use that device.		
Device driver compiled into the kernel	Configure the device driver by passing a kernel parameter in the GRUB menu: kernel /vmlinuz ro root=/dev/vg0/root vga=0x33c	
Edit module configuration in /etc/modprobe.conf or /etc/modprobe.d/ (Red		<pre>tc/modprobe.conf or /etc/modprobe.d/ (Red Hat):</pre>
Device driver provided as a kernel module	alias eth0 3c59x	Specify that eth0 uses the $3c59x$.ko driver module
	options 3c509 irq=10,11	Assign IRQ 10 and 11 to 3c509 devices

/proc filesystem

99/126

/proc pseudo filesystem		
Information stored	Equivalent command to cat	
Information about process with PID n	ps n	
Command line the process was launched by		
Values of environment variables of process		
Status of process		
Symlink to process' filesystem root		
Symlink to process' executable		
Symlink to process' working directory		
sysfs: exposes tunable kernel parameters		
Kernel information and parameters		
Network information and parameters		
Time elapsed since boot	uptime	
System load averages	uptime	
Filesystems supported by the system		
Drive partition information		
Information about RAID arrays and devices		
Size of total and used swap areas	swapon -s	
Mounted partitions	mount	
Drivers currently loaded		
Kernel modules currently loaded	lsmod	
Buses (e.g. PCI, USB, PC Card)		
I/O addresses in use		
DMA channels in use

 $/{\tt proc/sys}$ is the only writable branch of $/{\tt proc}$ and can be used to tune kernel parameters on-the-fly. All changes will be lost after system shutdown.

sysctl fs.file-max cat /proc/sys/fs/file-max	Get the maximum allowed number of open files
sysctl -w "fs.file-max=100000" echo "100000" > /proc/sys/fs/file-max	Set the maximum allowed number of open files to 100000
sysctl -a	List all available kernel tuning options
sysctl -p	Apply all tuning settings listed in /etc/sysctl.conf . This command is usually run at boot by the system initialization script and therefore allows for permanent changes to the kernel

If the kernel has been booted in emergency mode and init has not been run, some initial configuration is necessary e.g.

mount /proc
mount -o remount,rw /
mount -a

If mounting filesystems fails:

mknod /dev/sda mknod /dev/sda1 fdisk -1 /dev/sda fsck -y /dev/sda1 mount -t ext3 /dev/sda1 /mnt/sysimage chroot /mnt/sysimage

To install a package using an alternative root directory (useful if the system has been booted from a removable media):

rpm -U --root /mnt/sysimage package.rpm

To install GRUB on the specified directory (which must contain /boot/grub/):

grub-install --root-directory=/mnt/sysimage /dev/sda

An alternative metod is to chroot /mnt/sysimage before installing GRUB via grub-install /dev/sda.

Run sync and unmount filesystems before exiting the shell, to ensure that all changes have been written on disk.

		DNS implementations
	BIND	Berkeley Internet Name Domain system, is the standard DNS server for UNIX
	dnsmasq	Lightweight DNS, DHCP and TFTP server for a small network
	djbdns	Security-hardened DNS server that also includes DNS debugging tools
	PowerDNS	Alternative open-source DNS server
named	BIND Name [Daemon
ndc		on Controller for BIND 8
rndc		e Daemon Controller for BIND 9, uses a shared key to communicate securely with named
dnswalk ex	ample.org.	DNS debugger
rndc recor	nfig	Reload BIND configuration and new zones
rndc reloa	ad example.org	Reload the zone example.org
rndc freez	ze example.org	Suspend updates for the zone example.org
rndc thaw	example.org	Resume updates for the zone example.org
rndc tsig-	-list	List all currently active TSIG keys
sign zone transfers and DDNS (Dynamic dnssec-keygen -a dsa -b 1024 \ -n HOST dnsl.example.org		Generate a TSIG key with DNSSEC algorithm <i>nnn</i> and key fingerprint <i>fffff</i> .
rndc-confgen -a		Generate a /etc/rndc.key key file:
		<pre>key "rndc-key" { algorithm hmac-md5; secret "vyZqL3tPHsqnA57e4LT0Ek=="; }; options { default-key "rndc-key"; default-server 127.0.0.1; default-port 953; }; This file is automatically read both by named and rndc</pre>
dnssec-sig	ynzone example	.org Sign the zone example.org
named -u r	named -g named	Run BIND as user/group named (both must be created if needed) instead of root
named -t /	/var/cache/bind	d Run BIND in a chroot jail /var/cache/bind (actually is the chroot command that starts the named server)

```
/etc/named.conf DNS server configuration file
controls {
  inet 127.0.0.1 allow {localhost;} keys {rndckey;};
}:
key "rndc-key" {
                                                // TSIG key
  algorithm dsa;
  secret "HYZur46fftdUQ43BJKI093t4t78lkp";
};
acl "mynetwork" {10.7.0.0/24;};
                                                // Alias definition
                                                // Built-in ACLs: any, none, localhost, localnets
options {
  directory "/var/named";
                                                // Working directory
  version "0.0";
                                                // Hide version number by replacing it with 0.0 \,
  listen-on port 53 {10.7.0.1; 127.0.0.1; };
                                                // Port and own IP addresses to listen on
  blackhole {172.17.17.0/24;};
                                                // IPs whose packets are to be ignored
                                                //\ \mbox{IPs} allowed to do iterative queries
  allow-query {mynetwork;};
  allow-query-on {any;};
                                                // Local IPs that can accept iterative queries
  allow-query-cache {any;};
                                                //\ {\tt IPs} that can get an answer from cache
  allow-recursion {mynetwork;};
                                      // IPs to accept recursive queries from (typically
                                       // own network's IPs). The DNS server does the full
                                       // resolution process on behalf of these client IPs,
                                       // and returns a referral for the other \ensuremath{\texttt{IPs}}
                                      // Local IPs that can accept recursive queries
  allow-recursion-on {mynetwork;};
  allow-transfer {10.7.0.254;};
                                       // Zone transfer is restricted to these IPs (slaves);
                                       // on slave servers, this option should be disabled
  allow-update {any;};
                                      // IPs to accept DDNS updates from
  recursive-clients 1000;
                                      // Max number of simultaneous recursive lookups
  dnssec-enable yes;
                                      // Enable DNSSEC
  dialup no;
                                       // Not a dialup connection: external zone maintenance
                                       // (e.g. sending heartbeat packets, external zone transfers)
                                       \ensuremath{{//}} is then permitted
  forward first;
                                               // Site-wide cache: bypass the normal resolution
                                               // method by querying first these central DNS
  forwarders {10.7.0.252; 10.7.0.253; };

	Resource Records	
	\$TTL	How long to cache a positive response
	\$ORIGIN	Suffix appended to all names not ending with a dot. Useful when defining multiple subdomains inside the same zone
SOA	Start Of Author	rity for the example.org zone
	serial	Serial number. Must be increased after each edit of the zone file
	refresh	How frequently a slave server refreshes its copy of zone data from the master
	retry	How frequently a slave server retries connecting to the master
	expire How long a slave server relies on its copy of zone data. After this time period expires, the slave server is not authoritative anymore for the zone unless it can contact a master	
	negative TTL	How long to cache a non-existent answer
Α	Address: maps	names to IP addresses. Used for DNS lookups.
PTR	Pointer: maps IP addresses to names. Used for reverse DNS lookups. Each A record must have a matching PTR record	
CNAME	Canonical Name: specifies an alias for a host with an A record (even in a different zone). Discouraged as it causes multiple lookups; it is better to use multiple A records instead	
NS	Name Service: specifies the authoritative name servers for the zone	
МХ	Mailserver: specifies address and priority of the servers able to handle mail for the zone	
Glue Records are not really part of the zone; they delegate authority for other zones, usually subdomains		

Methods of MPM (Multi-Processing Modules) operation of the Apache webserver:

- prefork MPM A number of child processes is spawned in advance, with each child serving exclusively one connection. Highly reliable due to Linux memory protection that isolates each child process
- worker MPM Multiple child processes spawn multiple threads, with each thread serving one connection. More scalable but prone to deadlocks if third-party non-threadsafe modules are loaded

apache2ctl st	tart	Start the Apache webserver daemon httpd
apache2ctl st	tatus	Display a brief status report
apache2ctl fi	ullstatus	Display a detailed status report
apache2ctl gi	raceful	Gracefully restart Apache; currently open connections are not aborted
apache2ctl gi	raceful-stop	Gracefully stop Apache; currently open connections are not aborted
apache2ctl co	onfigtest	Test the configuration file, reporting any syntax error

/var/www/html	Default document root directory
\$HOME/public_html	Default document root directory for users' websites
Web content must be readable by the user/group the Apache process runs as. For security reasons, it should be owned and writable by the superuser or the webmaster user/group, not the Apache user/group.	

/etc/httpd/conf/httpd.conf (Red Hat)
/etc/apache2/httpd.conf (Debian and SUSE)
Apache configuration file

HTTPS

A secure web server (using HTTP over SSL i.e. HTTPS) hands over its public key to the client when the latter connects to it via port 443. The server's public key is signed by a CA (Certification Authority), whose validity is ensured by the root certificates stored into the client's browser.

The openssl command and its user-friendly CA.pl script are the tools of the OpenSSL crypto library that can be used to accomplish all public key crypto operations e.g. generate key pairs, Certificate Signing Requests, self-signed certificates.

Virtual hosting with HTTPS requires assigning an unique IP address for each virtual host; this because the SSL handshake (during which the server sends its certificate to the client's browser) takes place before the client sends the Host: header (which tells which virtual host the client wants to talk to). A workaround for this is SNI (Server Name Indication) that makes the browser send the hostname in the first message of the SSL handshake. Another workaround is to have all multiple name-based virtual hosts use the same SSL certificate with a wildcard domain *.example.org.

/etc/ssl/openssl.cnf

/etc/httpd/conf.d/ssl.conf (Red Hat)

Configuration file for OpenSSL Configuration file for the mod_ssl module

	httpd.conf
Server c	onfiguration directives
ServerName www.mysite.org:80	Name and port (if omitted, uses default HTTP port 80) of server
ServerRoot /etc/httpd	Root directory for config and log files
ServerAdmin webmaster@mysite.org	Contact address that the server includes in any HTTP error messages to the client. Can be an email address or an URL
StartServers 5	Number of servers to start initially
MinSpareServers 5 MaxSpareServers 10	Minimum and maximum number of idle child server processes
MaxClients 256 (before v2.3.13) MaxRequestWorkers 256 (after v2.3.13)	Max number of simultaneous requests that will be served; clients above this limit will get a HTTP error 503 - Service Unavailable. Prefork MPM: max number of child processes launched to serve requests. Worker MPM: max total number of threads available to serve requests
ServerLimit 256	Prefork MPM: max configured value for MaxRequestWorkers. Worker MPM: in conjunction with ThreadLimit, max configured value for MaxRequestWorkers
ThreadsPerChild 25	Worker MPM: number of threads created by each child process
ThreadLimit 64	Worker MPM: max configured value for ThreadsPerChild
LoadModule mime_module modules/mod_mime.so	Load the module mime_module by linking in the object file or library modules/mod_mime.so
Listen 10.17.1.1:80 Listen 10.17.1.5:8080	Make the server accept connections on the specified IP addresses (optional) and ports
User nobody Group nobody	User and group the Apache process runs as. For security reasons, this should not be ${\tt root}$
Main co	onfiguration directives
DocumentRoot /var/www/html	Directory in filesystem that maps to the root of the website
Alias /image /mydir/pub/image	Map the URL http://www.mysite.org/image/ to the directory /mydir/pub/image in the filesystem. This allows Apache to serve content placed outside of the document root
TypesConfig conf/mime.types	Media types file. The path is relative to ServerRoot
AddType image/jpeg jpeg jpg jpe	Map the specified filename extensions onto the specified content type. These entries adds to or override the entries from the media types file <code>conf/mime.types</code>
Redirect permanent /foo /bar	Redirect to a URL on the same host. Status can be:permanentreturn a HTTP status 301 - Moved Permanentlytempreturn a HTTP status 302 - Found(i.e. the resource was temporarily moved)seeotherreturn a HTTP status 303 - See Othergonereturn a HTTP status 410 - GoneIf status is omitted, default status temp is used
Redirect /foo http://www.example.com/foo	Redirect to a URL on a different host
AccessFileName .htaccess	Name of the distributed configuration file, which contains directives that apply to the document directory it is in and to all its subtrees
<directory "="" foobar"="" html="" var="" www=""> AllowOverride AuthConfig Limit </directory>	Specify which global directives a .htaccess file can override:AuthConfigauthorization directives for directory protectionFileInfodocument type and metadataIndexesdirectory indexingLimithost access controlOptionsspecific directory featuresAllall directivesNoneno directive

httpd.conf			
Virtual hosts directives			
NameVirtualHost *	Specify which IP address will serve virtual hosting. The argument can be an IP address, an <i>address:port</i> pair, or * for all IP addresses of the server. The argument will be repeated in the relevant <virtualhost> directive</virtualhost>		
<virtualhost *:80=""> ServerName www.mysite.org ServerAlias mysite.org *.mysite.org DocumentRoot /var/www/vhosts/mysite </virtualhost>	The first listed virtual host is also the default virtual host. It inherits those main settings that does not override. This virtual host answers to http://www.mysite.org , and also redirects there all HTTP requests on the domain mysite.org		
<virtualhost *:80=""> ServerAdmin webmaster@www.mysite2.org ServerName www.mysite2.org DocumentRoot /var/www/vhosts/mysite2 ErrorLog /var/www/logs/mysite2 </virtualhost>	Name-based virtual host http://www.mysite2.org . Multiple name-based virtual hosts can share the same IP address; DNS must be configured accordingly to map each name to the correct IP address. Cannot be used with HTTPS		
<pre><virtualhost *:8080=""> ServerName www.mysite3.org DocumentRoot /var/www/vhosts/mysite3 </virtualhost></pre>	Port-based virtual host answering to connections on port 8080. In this case the config file must contain a Listen 8080 directive		
<virtualhost 10.17.1.5:80=""> ServerName www.mysite4.org DocumentRoot /var/www/vhosts/mysite4 </virtualhost>	IP-based virtual host answering to http://10.17.1.5		
Logging directives			
LogFormat "%h %l %u %t \"%r\" %>s %b"	Specify the format of a log		
LogFormat "%h %l %u %t \"%r\" %>s %b" common	Specify a nickname (here, "common") for a log format. This one is the CLF (Common Log Format) defined as such: %h IP address of the client host %1 Identity of client as determined by identd %u User ID of client making the request %t Timestamp the server completed the request %r Request as done by the user %s Status code sent by the server to the client %b Size of the object returned, in bytes		
CustomLog /var/log/httpd/access_log common	Set up a log filename, with the format or (as in this case) the nickname specified		
TransferLog /var/log/httpd/access_log	Set up a log filename, with format determined by the most recent LogFormat directive which did not define a nickname		
TransferLog " rotatelogs access_log 86400"	Organize log rotation every 24 hours		
HostnameLookups Off	Disable DNS hostname lookup to save network traffic. Hostnames can be resolved later by processing the log file: logresolve <access_log>accessdns_log</access_log>		

	httpd.conf				
Limite					
Limited scope directives					
<pre><directory "="" foobar"="" html="" var="" www=""> [list of directives] </directory></pre>	Limit the scope of the specified directives to the directory /var/www/html/foobar and its subdirectories				
<pre><location foobar=""> [list of directives] </location></pre>	Limit the scope of the specified directive to the URL <pre>http://www.mysite.org/foobar/ and its subdirectories</pre>				
	protection directives				
<pre></pre>					
AuthName "Protected zone"	Name of the realm. The client will be shown the realm name and prompted to enter an user and password				
AuthType Basic	Type of user authentication: Basic, Digest, Form, or None				
AuthUserFile "/var/www/.htpasswd"	User database file. Each line is in the format user: encrypted_password To add an user jdoe to the database file, use the command: htpasswd -c /var/www/.htpasswd jdoe (will prompt for his password)				
AuthGroupFile "/var/www/.htgroup"	Group database file. Each line contains a groupname followed by all member usernames: mygroup: jdoe ksmith mgreen				
Require valid-user	Control who can access the protected resource.valid-userany user in the user database fileuser jdoeonly the specified usergroup mygrouponly the members of the specified group				
Allow from 10.13.13.0/24	Control which host can access the protected resource				
Satisfy Any	Set the access policy concerning user and host control. All both Require and Allow criteria must be satisfied Any any of Require or Allow criteria must be satisfied				
Order Allow, Deny	Control the evaluation order of Allow and Deny directives.				
	Allow, Deny First, all Allow directives are evaluated; at least one must match, or the request is rejected. Next, all Deny directives are evaluated; if any matches, the request is rejected. Last, any requests which do not match an Allow or a Deny directive are denied				
	Deny, Allow First, all Deny directives are evaluated; if any match, the request is denied unless it also matches an Allow directive. Any requests which do not match any Allow or Deny directives are permitted				

Apache SSL/TLS configuration

httpd.conf				
SSL/TLS directives (module mod_ssl)				
SSLCertificateFile \ /etc/httpd/conf/ssl.crt/server.crt	SSL server certificate			
SSLCertificateKeyFile \ /etc/httpd/conf/ssl.key/server.key	SSL server private key (for security reasons, this file should be readable only by root)			
SSLCACertificatePath \ /usr/local/apache2/conf/ssl.crt/	Directory containing the certificates of CAs. Files in this directory are PEM-encoded and accessed via symlinks to hash filenames			
SSLCACertificateFile \ /usr/local/apache2/conf/ssl.crt/ca-bundle.crt	Certificates of CAs. Certificates are PEM-encoded and concatenated in a single bundle file in order of preference			
SSLCertificateChainFile \ /usr/local/apache2/conf/ssl.crt/ca.crt	Certificate chain of the CAs. Certificates are PEM-encoded and concatenated from the issuing CA certificate of the server certificate to the root CA certificate. Optional			
SSLEngine on	Enable the SSL/TLS Protocol Engine			
SSLProtocol +SSLv3 +TLSv1.2	SSL protocol flavors that the client can use to connect to server. Possible values are: SSLv2 (deprecated) SSLv3 TLSv1 TLSv1.1 TLSv1.2 All (all the above protocols)			
SSLCipherSuite \ ALL:!aDH:RC4+RSA:+HIGH:+MEDIUM:+LOW:+SSLv2:+EXP	Cipher suite available for the SSL handshake (key exchange algorithms, authentication algorithms, cipher/encryption algorithms, MAC digest algorithms)			
ServerTokens Full	Server response header field to send back to client. Possible values are: Prod sends Server: Apache Major sends Server: Apache/2 Minor sends Server: Apache/2.4 Minimal sends Server: Apache/2.4.2 OS sends Server: Apache/2.4.2 (Unix) Full (or not specified) sends Server: Apache/2.4.2 (Unix) PHP/4.2.2 MyMod/1.2			
ServerSignature Off	Trailing footer line on server-generated documents. Possible values are: Off no footer line (default) On server version number and ServerName EMail as above, plus a mailto link to ServerAdmin			
SSLVerifyClient none	Certificate verification level for client authentication. Possible values are:			
	none no client certificate is required			
	require the client needs to present a valid certificate			
	optional the client may present a valid certificate (this option is unused as it doesn't work on all browsers)			
	optional_no_ca the client may present a valid certificate but it doesn't need to be successfully verifiable (this option has not much purpose and is used only for SSL testing)			
TraceEnable on	Enable TRACE requests

openssl list-message-digest-commands openssl list-cipher-commands Read a certificate

Read a Certificate Signing Request

Generate a Certificate Signing Request (in PEM format) for the public key of a key pair

Create a 2048-bit RSA key pair and generate a Certificate Signing Request for it

Generate a new CA private key, create a 2048-bit RSA key pair and generate a CSR for it

Sign a CSR (to generate a self-signed certificate, the steps are creating a CSR and signing it)

Revoke a certificate

Generate a Certificate Revocation List containing all revoked certificates so far

Convert a certificate from PEM to DER

Convert a certificate from PEM to PKCS#12 including the private key

Create a PEM certificate from CRT and private key

Generate the digest of a file

Verify the digest of a file (if there is no output, then digest verification is successful)

Generate the signature of a file

Verify the signature of a file

Encrypt a file

Decrypt a file

Generate a 2048-bit RSA key pair protected by TripleDES passphrase

Generate a 2048-bit RSA key pair protected by TripleDES passphrase (older versions of OpenSSL)

Examine a private key

Examine a private key (older versions of OpenSSL)

Change the passphrase of a private key

Change the passphrase of a private key (older versions of OpenSSL)

Remove the passphrase from a private key

Retrieve and inspect a SSL certificate from a website

List all available hash functions List all available ciphers

CA.pl -newca	Create a Certification Authority hierarchy
CA.pl -newreq	Generate a Certificate Signing Request
CA.pl -signreq	Sign a Certificate Signing Request
CA.pl -pkcs12 "Certificate name"	Generate a PKCS#12 certificate from a Certificate Signing Request
CA.pl -newcert	Generate a self-signed certificate
CA.pl -newreq-nodes	Generate a Certificate Signing Request, with unencrypted private key (this is necessary for use in servers, because the private key is accessed in non-interactive mode i.e. without passphrase typing)
CA.pl -verify	Verify a certificate against the Certification Authority certificate for "demoCA"

Samba

Samba is a cross-platform implementation of Microsoft's SMB (Server Message Block) protocol for file and printer sharing. SMB is sometimes also referred to as CIFS (Common Internet File System). WINS (Windows Internet Name Service) is a name service used to translate NetBIOS names to IP addresses.

Ports used:	TCP 137 TCP 138 TCP 139 UDP	name service requests and responses datagram services e.g. server announcements file and printer sharing registration and translation of NetBIOS names, network browsing					
smbd	Server Message Block daemon. Provides SMB file and printer sharing, browser services, user authentication, and resource lock. An extra copy of this daemon runs for each client connected to the server						
nmbd	An extra copy	of this daemon runs if Samba fu	BIOS name lookups, WINS requests, list browsing and elections. nctions as a WINS server. is used to translate NetBIOS names				
/etc/smb/lm	hosts		Samba NetBIOS hosts file				
/etc/smb/ne	tlogon		User logon directory				
	//smbserver/ dentials=/et	sharel /mnt/shares/shl \ c/smbcreds	Mount a Samba share on a Linux filesystem, using the CIFS filesystem interface. Access is checked upon a credentials file /etc/smbcreds (should be readable only by root) formatted as follows: username = jdoe password = jd03s3cr3t				
smbmount // -o username		arel /mnt/shares/shl $\$	Mount a Samba share as user jdoe				
smbstatus			Display current information about shares, clients connections, and locked files				
smbclient /	/smbserver/s	harel	Access a Samba share on a server (with a FTP-like interface)				
smbclient -L // <i>smbserver</i> -W <i>WORKGROUP</i> -U <i>user</i>		r -W WORKGROUP -U user	List the Samba resources available on a server, belonging to the specified workgroup and accessible to the specified user				
cat msg.txt	smbclient	-M client -U user	Show a message popup on the client machine (using the WinPopup protocol)				
smbpasswd j	doe		Change the Samba password of the specified user				
smbpasswd -	a ksmith		Create a new Samba user and set his password				
nmblookup <i>s</i>	mbserver		Look up the NetBIOS name of a server and map it to an IP address				
nmblookup -	U winsserver	-R WORKGROUP#1B	Query recursively a WINS server for the Domain Master Browser for the specified workgroup				
nmblookup -	U winsserver	-R WORKGROUP#1D	Query recursively a WINS server for the Domain Controller for the specified workgroup				
testparm			Check for errors in the Samba configuration file				
net			Tool for administration of Samba and remote CIFS servers				
net rpc shu	tdown -r -S	smbserver -U root%password	Reboot a CIFS server				
net rpc ser	vice list -S	smbserver	List available service on a CIFS server				
net status	sessions		Show active Samba sessions				
net status	shares		Show Samba shares				
net rpc inf	0		Show information about the domain				
net groupmap list			Show group mappings between Samba and Windows				

/etc/smb/smb.conf Samba configuration				
[global]	Global server settings: defines parameters applicable for the whole Samba server and sets the defaults that will be used for the parameters not mentioned in other sections			
workgroup = MYWORKGROUP	Make Samba join the specified workgroup			
server string = Linux Samba Server %L	Describe server to the clients			
hosts allow = 10.9.9.0/255.255.255.0	Allow only the specified machines to connect to the server			
security = user	Set up user-level authentication			
encrypt passwords = yes	Use encrypted passwords			
smb passwd file = /etc/smb/smbpasswd	Refer to the specified password file for user authentication. A new user's password will need to be set both in Linux and Samba by using these commands from shell prompt: passwd newuser smbpasswd newuser			
unix password sync = yes	When the password of a client user (e.g. under Windows) is changed, change the Linux and Samba password too			
username map = /etc/smb/smbusers	<pre>Map each Samba server user name to client user name(s). The file /etc/smb/smbusers is structured as follows: root = Administrator Admin jdoe = "John Doe" kgreen = "Kim Green"</pre>			
netbios name = Mysambabox netbios aliases = Mysambabox1	Set NetBIOS name and alias			
wins support = yes	Make Samba play the role of a WINS server. Note: There should be only one WINS server on a network			
logon server = yes	Enable logon support. Logon script parameters will be defined in a [netlogon] section			
<pre>log file = /var/log/samba/log.%m</pre>	Use a separate logfile for each machine that connects			
max log size = 1000	Maximum size of each logfile, in Kb			
syslog only = no	Whether to log only via Syslog			
syslog = 0	Log everything to the logfiles /var/log/smb/log.smbd and /var/log/smb/log.nmbd, and log a minimum amount of information to Syslog. This parameter can be set to a higher value to have Syslog log more information			
<pre>panic action = \ /usr/share/samba/panic-action %d</pre>	Mail a backtrace to the sysadmin in case Samba crashes			
<pre>[netlogon] comment = Netlogon for Windows clients path = /home/netlogon browseable = no guest ok = no writeable = no logon script = %U.bat</pre>	Section defining a logon script. Specifies a per-user script e.g. /home/netlogon/jdoe.bat will be called when user jdoe logs in. It is also possible to specify a per- clientname script %m.bat, which will be called when a specific machine logs in. Guest access to the service (i.e. access without entering a password) is disabled			
<pre>[Canon LaserJet 3] printer name = lp comment = Canon LaserJet 3 main printer path = /var/spool/lpd/samba printable = yes writeable = no</pre>	Section defining a printer accessible via the network			

Samba shares

/etc/smb/smb.conf Samba configuration				
[public]	Section defining a public share accessible on read/write by anyone			
comment = Public Storage on %L	Describe the public share to users			
<pre>path = /home/samba</pre>	Path of the public share on the server			
browsable = yes	Whether to show the public share when browsing			
writeable = yes	Whether to allow all users to write in this directory			
[homes]	Section enabling users that have an account and a home directory on the Samba server to access it and modify its contents from a Samba client. The path variable is not set, by default is path=/home/%S			
comment = %U's home directory on %L from %m	Describe the share to the user			
browseable = no	Whether to show the homes share when browsing			
writeable = yes	Whether to allow the user to write in his home directory			
[foobar]	Section defining a specific share			
<pre>path = /foobar comment = Share Foobar on %L from %m browsable = yes writeable = yes</pre>				
valid users = jdoe, kgreen, +geeks	Allow access only to users jdoe and kgreen, and local group geeks			
invalid users = csmith	Deny access to user csmith			
read list = bcameron	Allow read-only access to user bcameron			
write list = fcastle	Allow read-write access to user fcastle			

	Samba share access		
	User-level authentication		
[global] security = user	Set up user-level authentication		
guest account = nobody	Map the guest account to the system user nobody (default)		
map to guest = Never	Specify how incoming requests are mapped to the guest account:Bad Userredirect from an invalid user to guest account on serverBad Passwordredirect from an invalid password to guest account on serverNeverreject unauthenticated users		
	Server-level authentication		
<pre>[global] security = server password server = srv1 srv2</pre>	Set up server-level authentication Authenticate to server srv1, or to server srv2 if srv1 is unavailable		
-	Domain-level authentication		
[global] security = ADS realm = KRB_REALM	Set up domain-level authentication as an Active Directory member server Join the specified realm. Kerberos must be installed and an administrator account must be created: net ads join -U Administrator% <i>password</i>		
Share-level authentication			
<pre>[global] security = share [foobar] path = /foobar username = foobaruser only user = yes</pre>	Set up share-level authentication Define a share accessible to any user which can supply foobaruser's password. The user foobaruser must be created on the system: useradd -c "Foobar account" -d /tmp -m -s /sbin/nologin foobaruser and added to the Samba password file: smbpasswd -a foobaruser		

Samba macros

	Samba macros		
%S	Username		The substitutes below apply only to the
%U	Session username (the username that the client requested, not necessarily the same as the one he got)	configuration options that are used when a connection has been established:	
%G	Primary group of session username	%S	Name of the current service, if any
%h	Samba server hostname	%₽	Root directory of the current service, if any
%М	Client hostname	%u	Username of the current service, if any
%L	NetBIOS name of the server	۶g	Primary group name of username
%m	NetBIOS name of the client	%Н	Home directory of username
%d	Process ID of the current server process	%N	Name of the NIS home directory server as
%a	Architecture of remote machine	obtained from the NIS auto.map entry. Same as %L if Samba was not compiled	
%I	IP address of client machine		thewith-automount option
%i	Local IP address to which a client connected	%p	Path of service's home directory as obtained
%T	Current date and time	from the NIS auto.map entry. The NIS auto.map entry is split up as %N:%p	
%D	Domain or workgroup of the current user		auto map chity is spire up us one op
%w	Winbind separator		
%\$(var)	Value of the environment variable var		

A Network File System (NFS) server makes filesystems available to clients for mounting.

The portmapper is needed by NFS to map incoming TCP/IP connections to the appropriate NFS RPC calls. Some Linux distributions use rpcbind instead of the portmapper. For security, the TCP Wrapper should be configured to limit access to the portmapper to NFS clients only: file /etc/hosts.deny should contain portmap: ALL

file /etc/hosts.allow should contain portmap: IP addresses of clients

NFS handles user permissions across systems by considering users with same UID and username as the same user. Group permission is evaluated similarly, by GID and groupname.

rpc.nfsd rpc.mountd rpc.lockd rpc.statd	NFS daemons					
/etc/exports	List of the filesystems to be exported (via the command $exports$)					
/var/lib/nfs/xtab	List of exported filesystems, maintained by exportfs					
/proc/fs/nfs/exports	Kernel export	table (can be e	examine	d via th	e commar	nd cat)
exportfs -ra	Export or reexport all directories. When exporting, fills the kernel export table /proc/fs/nfs/exports. When reexporting, removes those entries in /var/lib/nfs/xtab that are deleted from /etc/exports (therefore synchronizing the two files), and removes those entries from /proc/fs/nfs/exports that are no longer valid					
exportfs -ua	Unexport all directories. Removes from /proc/fs/nfs/exports all those entries that are listed in /var/lib/nfs/xtab, and clears the latter file					
showmount	Show the remote client hosts currently having active mounts					
showmountdirectories	Show the directories currently mounted by a remote client host					
showmountexports	Show the filesystems currently exported i.e. the active export list					
showmountall	Show both re	mote client hos	ts and c	lirectorie	es	
showmount -e <i>nfsserver</i>	Show the sha	ares a NFS serve	er has a	vailable	for moun	ting
mount -t nfs <i>nfsserver</i> :/share /usr	Command to be run on a client to mount locally a remote NFS share. NFS shares accessed frequently should be added to /etc/fstab : nfsserver:/share /usr nfs intr 0 0					
rpcinfo -p <i>nfsserver</i>	Probe the portmapper on a NFS server and display the list of all registered RPC services there					
rpcinfo -t <i>nfsserver</i> nfs	Test a NFS connection by sending a null pseudo request (using TCP)					
rpcinfo -u <i>nfsserver</i> nfs	Test a NFS connection by sending a null pseudo request (using UDP)					
nfsstat	Display NFS/RPC client/server statistics.					
			NFS	RPC	both

/export/	*(ro,sync)
/home/ftp/pub	client1(rw) *.example.org(ro)
/home/crew	@FOOBARWORKGROUP(rw) (ro)

filesystem	Filesystem on the NFS server to be exported to clients			
client identity	Client systems allowed to access the exported directory. Can be identified by hostname, IP address, wildcard, subnet, or @NIS workgroup. Multiple client systems can be listed, and each one can have different options			
	ro	ro Read-only access (default)		
	rw	Read and write access. The client may choose to mount read-only anyway		
	sync	Reply to requests only after the changes made by these requests have been committed to stable storage		
client options	async	Reply to requests without waiting that changes are committed to stable storage. Improves performances but might cause loss or corruption of data if server crashes		
•	root_squash	Requests by user root on client will be done as user nobody on server (default)		
	no_root_squash	Requests by user root on client will be done as same user root on server		
	all_squashRequests by a non-root user on client will be done as user nobody on serverno_all_squashRequests by a non-root user on client will be attempted as same user on server (defa			

DHCP

A DHCP (Dynamic Host Configuration Protocol) server listens for requests on UDP port 67 and answers to UDP port 68. The assignment of an IP address to a host is done through a sequence of DHCP messages initiated by the client host: DHCP Discover, DHCP Offer, DHCP Request, DHCP Acknowledgment.

Because DHCP Discover messages are broadcast and therefore not routed outside a LAN, a DHCP relay agent is necessary for those clients situated outside the DHCP server's LAN. The DHCP relay agent listens to DHCP Discover messages and relays them in unicast to the DHCP server.

/etc/dhcpd.conf

Configuration file for the DHCP server

/etc/sysconfig/dhcrelay (SUSE)

/var/lib/dhcpd/dhcpd.leases

configuration me for the Drick server

Configuration file for the DHCP relay agent

DHCP current leases

/etc/dhcpd.conf					
option domain-name-servers 10.2.2.2; option smtp-servers 10.3.3.3; option pop-servers 10.4.4.4; option time-servers 10.5.5.5; option nntp-servers 10.6.6.6;	Global parameters for DNS, mail, NTP, and news servers specification

} group {	Definition of a group				
<pre>option routers 10.0.17.252; option broadcast-address 10.0.17.255; netmask 255.255.255.0; host linuxbox1 { hardware ethernet AA:BB:CC:DD:EE:FF; fixed-address 10.0.17.42; option host-name "linuxbox1"; } host linuxbox2 { hardware ethernet 33:44:55:66:77:88; fixed-address 10.0.17.66; option host-name "linuxbox2"; } }</pre>	Definition of different hosts to whom static IP addresses will be assigned to, depending on their MAC address				

PAM (Pluggable Authentication Modules) is an abstraction layer that allows applications to use authentication methods while being implementation-agnostic.

/etc/pam.d/service	PAM configuration for service
/etc/pam.conf (obsolete)	PAM configuration for all services
ldd /usr/sbin/ <i>service</i> grep libpam	Check if service is enabled to use PAM

			/etc/pam.d/ <i>service</i>					
		auth auth auth account session password	requisite required required required required optional required	<pre>pam_securetty.so pam_nologin.so pam_env.so pam_unix.so nullok pam_unix.so pam_unix.so pam_unix.so pam_unix.so pam_lastlog.so pam_unix.so nullok obscure min=4 max=8</pre>				
	auth	Authen	tication modu	le to verify user identity and group membership				
type	account	Authori	zation module	e to determine user's right to access a resource (othe	r than his identity)			
суре	password	Module	to update an	user's authentication credentials				
	session	Module	(run at end a	and beginning of an user session) to set up the user e	nvironment			
	optional Module is		is not critical	to the success or failure of service				
				ule successes, and no previous module has failed, module stack processing ends y. If this module fails, it is non-fatal and processing of the stack continues				
control	required	required If this mod		processing of the stack continues until the end, and se	ervice fails			
	requisite If this mod		nodule fails, s	service fails and control returns to the application that	t invoked <i>service</i>			
	include	Include	modules fror	n another PAM service file				
	PAM modu	ule and its op	tions, e.g.:					
	pam_unix	.SO	Standard	d UNIX authentication module via <code>/etc/passwd</code> and <code>/d</code>	etc/shadow			
	pam_nis.	50	Module f	Module for authentication via NIS				
module	pam_ldap	.so	Module f	Module for authentication via LDAP				
module	pam_fsha	dow.so	Module f	Module for authentication against an alternative shadow passwords file				
	pam_crac	klib.so	Module f	Module for password strength policies (e.g. length, case, max n of retries)				
	pam_limi	ts.so	Module f	Module for system policies and system resource usage limits				
	pam_list:	file.so	Module t	o deny or allow the service based on an arbitrary text	t file			

LDAP (Lightweight Directory Access Protocol) is a simplified version of the X.500 standard and uses TCP port 389. LDAP permits to organize hierarchically a database of entries, each one of which is identified by an unique DN (Distinguished Name). Each DN has a set of attributes, each one of which has a value. An attribute may appear multiple times.

Most frequently used LDAP attributes								
Attribute	Example	Meaning						
dn	dn: cn=John Doe,dc=example,dc=org	Distinguished Name (not an attribute; identifies the entry)						
dc	dc=example,dc=org	Domain Component						
cn	cn: John Doe	Common Name						
givenName	givenName: John	Firstname						
sn	sn: Doe	Surname						
mail	mail: jdoe@example.org	Email address						
telephoneNumber	telephoneNumber: +1 505 1234 567	Telephone number						
uid	uid: jdoe	User ID						
с	c: US	Country code						
1	l: San Francisco	Locality						
st	st: California	State or province						
street	street: 42, Penguin road	Street						
0	o: Example Corporation	Organization						
ou	ou: IT Dept	Organizational Unit						
manager	<pre>manager: cn=Kim Green,dc=example,dc=org</pre>	Manager						

ldapsearch -H ldap://ldapserver.example.org \
-s base -b "ou=people,dc=example,dc=com" \
"(sn=Doe)" cn sn telephoneNumber

ldappasswd -x -D "cn=Admin,dc=example,dc=org" \
-W -S "uid=jdoe,ou=IT Dept,dc=example,dc=org"

ldapmodify -b -r -f /tmp/mods.ldif

ldapadd -h ldapserver.example.org \
-D "cn=Admin" -W -f /tmp/mods.ldif

ldapdelete -v "uid=jdoe,dc=example,dc=org" \
-D "cn=Admin,dc=example,dc=org" -W

Query the specified LDAP server for entries where surname=Doe, and print common name, surname, and telephone number of the resulting entries. Output is shown in LDIF

Authenticating as Admin, change the password of user jdoe in the OU called IT Dept, on example.org

Modify an entry according to the LDIF file /tmp/mods.ldif

Authenticating as Admin, add an entry by adding the content of the LDIF file /tmp/mods.ldif to the directory. Actually invokes the command ldapmodify -a

Authenticating as Admin, delete the entry of user jdoe

LDIF (LDAP Data Int	erchange Format)
<pre>dn: cn=John Doe, dc=example, dc=org changetype: modify replace: mail mail: johndoe@othercorp.org - add: jpegPhoto</pre>	This LDIF file will change the email address of jdoe, add a picture, and delete the description attribute for the entry
<pre>jpegPhoto:< file://tmp/jdoe.jpg _ delete: description _</pre>	

slapd	Standalone OpenLDAP daemon
/var/lib/ldap/	Files constituting the OpenLDAP database
/etc/openldap/slapd.conf /usr/local/etc/openldap/slapd.conf	OpenLDAP configuration file
slapcat -l file.ldif	Dump the contents of an OpenLDAP database to a LDIF file
slapadd -l file.ldif	Import an OpenLDAP database from a LDIF file
slapindex	Regenerate OpenLDAP's database indexes

SSSD (the System Security Services Daemon) can be used to provide access to OpenLDAP as an authentication and identity provider.

Security-Enhanced Linux (SELinux) is a Linux kernel security module that provides a mechanism for supporting access control security policies.

	Debian	Red Hat
Enter permissive mode	echo 0 > /selinux/enforce	setenforce 0
Enter enforcing mode	echo 1 > /selinux/enforce	setenforce 1
Display mode	cat /selinux/enforce	getenforce
Display mode cat /selinux/enforce Set mode permanently		<pre>Mode can be configured permanently in /etc/selinux/config (symlinked in /etc/sysconfig/selinux) # This file controls the state of SELinux on the system. # SELINUX= can take one of these three values: # enforcing - SELinux security policy is enforced. # permissive - SELinux prints warnings instead of enforcing. # disabled - No SELinux policy is loaded. SELINUX=enforcing # SELINUXTYPE= can take one of these two values: # targeted - Only targeted network daemons are protected. # strict - Full SELinux protection. SELINUXTYPE=targeted</pre>
